TABLE OF CONTENTS.

LETTER I .- P. 1.

On the Necessity of chaining a Knowledge of the Intellectual Faculties, in order to their proper Cultivation.—How this Knowledge is to be acquired.—Futility of endeavouring to cultivate the Faculties out of the Order prescribed by Nature.—A short Analysis of the Plan to be pursued.—Reflections.

LETTER II.—P. 31.

PERCEPTION.

Progressive Development of the Faculties.—Perception explained.—Hints toward its Cultivation in early Infancy.—Its Connexion with the benevolent Affections.

LETTER III.-P. 57.

ATTENTION.

The power of Attention in improving the Perceptions.

—The Velocity of its Operation so great as to render
it frequently imperceptible.—The Influence of the
Passions upon Attention.—Illustrations by Example.

LETTER IV.—P. 96.

CONCEPTION.

Introductory Observations.—Mr. Locke's Definition of Discernment applicable to Conception.—Evils arising from tee want of clear and accurate Ideas.—How these are to be obtained.—Conception to be exercised in early Life, on the Objects of Perception.—Books.—Peculiarity of Temperament.—The Conceptions of melancholy Persons languid.—Observations.

LETTER V.-P. 127.

Possessed in different Degrees of Vigour.—How it may best be cultivated in those of slow Capacity.—Exemplified in a Variety of Inflances.—Difference betwist a Memory of Porception, and the Recollection of Ideas.—The Advantage of cultivating the latter.—Illustrations.

LETTER VI.-P. 161.

CONCEPTION.

Lively Tempers particularly liable to Inaccuracy.— How this Fault is to be obvioted.—Proper Exercise of Memory in early Life considered.—Illustrations, CONTENTS

LETTER VII.-P. 195.

TUDGMENT

First begins to operate upon the Objects of Perception.

—Necessity of exercising it upon sensible Objects.—
How it may at first be exercised on moral Propositions.—Party Prejudice inimical to its Caltivation.

—Observations on this Head.—The Use of History.

LETTER VIII .- P. 229.

TUDGMENT.

Observations upon the Method to be pursued in reading History.—Premature Cultivation of Imagination, hartful to Judgment.—Other Obstacles to its Improvement examined.—Mode of Female Education formerly adopted, more favourable to Judgment than the moderu.—Examples.

LETTER 1X .- P. 267.

JUDGMENT.

Farther Illustrations on the Method of cultivating this Faculty.—Education of the lower Orders.— Religious Instruction of the Poor, and of the Rich.

LETTER X .- P. 200

IMAGINATION AND TASTE.

Imagination defined.—Necessity of its Operations being guided by Judgment.—Illustrations.—Definition of Taste.—Mistakes concepting the Cultivation of this Faculty.—Union of Conception and Judgmens essential to its Cultivation.—Illustrations.

LETTER XI .- P. 340.

ABSTRACTION.

Explanation of the Term.—Use of Abstraction in Science, in Reasoning, and in the Conduct of Life.

LETTER XII .- P. 363.

ABSTRACTION.

Character of those who object to the Cultivation of the Reasoning Faculty in the Female Sex.—Other Objections stated and examined.—Means to be employed in preparing the Mind for the Exercise of Abstraction.

LETTER XIII.-P. 405.

REFLECTION.

Different Applications of the Term.—Sense in which it is at present used.—Advantages of Reflection.—Foundation of it to be laid in early Life.—Instituty of Reflection, when not exercised under the Influence of religious Principle.—Illustrations.—Conclusion.

Hadainaanaanaanaanaan

LETTER I.

On the Necessity of obtaining a Knowledge of the Intellectual Faculties, in order to their proper Cultivation.—How this Knowledge is to be acquired.—Futility of endeavouring to cultivate the Faculties out of the Order prescribed by Nature.—A short Analysis of the Plan to be pursued.—Reflections.

MY DEAR FRIEND,

HAVING endeavoured to point out the necessity of paying an early and unremitting attention to the active powers of the human mind, it now remains for me to attempt an examination of the principles upon which we ought to proceed in the Improvement of the Intellectual Faculties. If we admit, as a fundamental principle, that the true end of education is to bring all the powers and faculties of our nature to

the highest persection of which they are capable; it evidently follows, that an adequate knowledge of these powers and faculties is absolutely necessary rowards the accomplishment of the end we have in view. The diffusion of this species of knowledge would doubtless correct many errors, both in theory and practice; and did it once become general among those with whom the first years of life are commonly spent, would produce consequences of the utmost importance to society.

But where are we to fearch for this defirable information? Must we turn to the voluminous works of philosophers, and there feek for this hidden treasure, amid all the rubbish of conjecture and hypothesis? Such a task would be, to the generality of our sex, impossible: nor were it possible, would it probably be attended with much advantage.

To explore the nature of the human mind is, indeed, the proper object of metaphylicalenquiry; but few-philosophers have been at sufficient pains to discriminate and ascertain the different degrees of certainty that attend their discoveries. With all that is speculative or conjectural upon this subject we have properly no concern; but happily for us, we may derive an adequate knowledge of all that is true and certain, by means of reslection and observation."

"We take it for granted," lays the venerable Reid, "that, by attentive relection, a man may gain a clear and certain knowledge of the operations of his own mind: a knowledge no lefs clear and certain than that whichhe has of an external object, when it is fet before his eyes. Another fource of information upon this fubject is a due attention to the course of human actions and conduct. The actions of men are effects; their fentiments, their passions, and their affections, are causes of those effects, and we may, in many cases, form a judgment of the cause from the effect. Not only the actions, but even the opinions, of men, may sometimes

give light into the frame of the human mind. The opinions of men may be confidered as the effects of their intellectual powers, as their actions are the effects of their active principles. Even the prejudices and errors of mankind, when they are general, must have some cause no less general; the discovery of which will throw some light upon the frame of the human understanding."

Fortified by fuch authority, I need not feruple to aver, that by reflection upon the operations of our own minds, and attentive observation of the conduct and opinions of others, we may attain all the information that is absolutely requisite for us upon the subject in question; and that the greatest advantage to be derived from the disquisitions of the learned is the leading our minds to a more attentive reflection and observation than we might otherwise be inclined to bestow. "The understanding," as Mr. Locke beautifully

observes, "like the eye, whilst it makes us fee and perceive all other things, takes no notice of itself; and it requires art and pains to set it at a distance, and make it its own object." This "art and pains" are implied in serious reslection; and to this reslection it is the object of these volumes to call the guardians of the rising generation.

Let it not be imagined, that I mean to engage my fex in the nice tubeleties of logic or metaphyfics. It is not for the purpose of exercising their minds in uteless speculation, that I exhort them to the species of inquiry alluded to; but it is to enable them to disclarge, with fidelity and honour, the momentous duties to which Providence has been pleased to call them.

Parents are the agents of the Moll High in extending the bleffing of existence. But in giving life to a new race of beings is their agency at an end? Ought they not still to confider themselves as the instruments of the Deity, employed by Him to

train up a certain portion of his rational offspring to capacity for the enjoyment of that felicity which He has prepared for those who love Him? In all that we know of his decrees, we behold a provision for the gradual improvement and final perfection of the human race. In this beneficent plan parents have the privilege of co-operating. Glorious privilege! Who that had a sense of its importance would facrifice it at the shrine of vanity, or relinquish it at the suggestion of felish indolence?

mothers is entrusted the care of rational beings in the most important period of their existence; the springs of human conduct are in their hands. From them must the nascent passions and affections of the heart receive their direction; by them must the germ of intellect be taught to expand; by them must the foundation be laid of all that is great, and good, and admirable, in human character. These are the important privileges by which our fex is honoured;

these are the duties to which it is called, Let not affistance towards the due performance of them be despised, however humble the hand that offers it.

In entering upon the Cultivation of the Understanding, it is necessary to premise that I do not intend to prescribe any particular course of study, or to point but the best methods of instruction in any branch of learning or of science. To shole, therefore, who confine their views solely to the acquirement of this or that accomplishment, my other various will necessarily appear dull and mannerating, securic totally destitute of rules that may shelltrate the attainment of their particular chieft.

It is observed by an amount to which I am always provide to refer, that to infured youth in the languages and in the sciences is comparatively of little importance, if we are inattentive to the habits they acquire; and are not careful in giving to all the different faculties, and all their different principles

principles of action, a proper degree of employment. Abstracting entirely from the culture of their moral powers, how extenfive and difficult is the bufiness of conducting their intellectual improvement! To watch over the affociations which they form in their tender years; to give them early habits of mental activity; to rouse their curiofity, and to direct it to proper objects; to exercise their ingenuity and invention; to cultivate in their minds a turn for speculation, and at the same time preserve their attention alive to objects around them; to awaken their attention to the beauties of nature, and to inspire them with a relish for intellectual enjoyment; these form but yet the execution even of this part requires an acquaintance with the general principles of our nature, which feldom falls to the youth is commonly entrusted."*

^{*} Elements of the Philosophy of the Human Mind,p.24.

The sketch that is here drawn by a masterly hand, will better explain to you my notions upon the subject of intellectual improvement than the most laboured definition. Still I must agree with the enlightened author, that these particulars form but a part of the business of education: They are but a few of the necessary means that must be employed in accomplishing our great end.

To qualify a human being for the true enjoyment of existence, the highest cultivation of the langlestual powers will not be sufficient, and its their powers be properly directed; this direction they must receive from the bias that has been given to the defires and affections of the heart. If these defires and affections have been corrupted by improper sadulgence, or perverted and deprayed by means of powerful impressions made upon the tender mind, we may give our children knowledge, we may give them learning, we may give

them accomplishments, but we shall never be able to teach them to apply these acquirements to just or noble purposes.

To explain and to urge the importance of giving fuch a direction to the active powers of the mind, as is agreeable to the precepts of divine philosophy, was the particular object of my first Series of Letters. But though my view was there chiefly directed towards the Culture of the Heart, it was impossible so entirely to separate subjects in themselves united, as not to blend my ideas of the early cultivation of the mental powers with what I advanced on the cultivation of the affections. The subjects, indeed, ought never to be confidered as feparate and diffinet; though, from our limited powers, it is necessary, in works of this nature, to view them in fuccession.

That the greatest perfection of which our nature is susceptible, consists in the capability of exerting, in an eminent degree, not one or two of the faculties with which

Providence

Providence has endowed us, BUT THE WHOLE OF THESE FACULTIES; and of having the direction given to this exertion, under the conflant influence of the pious and benevolent affections; I believe few will be inclined to deny. This is the perfection after which we ought inceffantly to labour; of this perfection it has pleafed the DETTY to give us an example in Him, who, in compaffion to our infimities, took not on him the nature of Angle that is to fay, gave us not an example of perfection beyond the grafp of our prefent faculties to conceive, or of our prefent powersto intracte.

In the character of our bleffed Saviour we behold the union of the intellectual and moral powers of man in their most exalted state of perfection; nor is it doing justice either to his example or his precepts, to keep our eye fixed upon one part of the character, while we neglect the other. His precepts and example are never at variance; while he taught the necessity and advantage

vantage of improving every talent with which Heaven has entrusted us, he displayed every faculty of the human mind exerted in the cause of piety and virtue. To give our children such a partial and imperfect education, as shall render them inclined to bury their talents in the earth, is to act directly contrary to the commands of Him, who gives them with an express injunction that they may be occupied.

As the body is composed of a variety of organs, of which each is equally necessary to the well-being of the whole; so the mind is a compound, if I may so speak, of a variety of faculties, none of which can be desective, without enseebling or injuring the rest. The lungs are not more necessary to the functions of the heart, than accurate conception to sound judgment. The circulation of the blood is not more necessary to the animal economy, than memory is to the mental. But memory depends upon attention; the accuracy of conception has

the fame fource: and if both are not duly exercifed by means of the perceptions, neither will attain perfection.

Where any one of the faculties has obtained a manifest ascendancy, the character will be imperfect, unhappy in itself, and useless to society. This irregular shoot is fometimes dignified by ignorance with the name of genius; but genius is not the partial vigour of a fingle faculty, -it implies the possession of all the powers of the mind in an eminent degree. The new combinations which genius produces, either in literature or in the arts, are the production of vigorous conception and found judgment; aided by the creative power of imagination, and modelled by tafte. Where any of these appear to be wanting, the inventions of genius must be proportionally defective. To fuppose that genius can exist without them, is abfurd.

The fame want of reflection leads into other errors, which are frequent causes of disappoint-

difappointment. In the prefent state of refinement, the cultivation of Taste is an object of much importance: in the education of young ladies, it indeed often appears to be the only object that is deemed worthy of attention. To afcertain the best and most certain method of cultivating this faculty will, therefore, I doubt not, be confidered as a very defirable object. If these Letters areread with attention, I hope the discovery will be made. I do not despair of convincing the most incredulous, of the utter impossibility of cultivating Taste, without the previous cultivation of the leading faculties. It is here, however, necessary to premise, that by Taste, wherever the word occurs, I invariably mean that faculty of the mind, whereby we are enabled to perceive, and to feel, whatever is beautiful or fublime in Nature or in the Arts. It is necessary to give this definition, because the term is often applied to denote predilection; and this application of it has given rife to much confusion,

not only in colloquial language, but in the writings of fome ingenious authors. A predilection for music or painting may be acquired by means of habit and of affociation; but these are inadequate to the production of the emotions of Taste, which have their origin in other sources. All animals that have nice perceptions, are capable of acquiring a predilection for certain sounds or colours; but the emotions of Taste are peculiar to the human race, and even in man are conflued to the slippe of the cultivated.

The fame foculties which must make their operations in order to conder the mind fuscopible of the emotions of fubli-inity or beauty, me capally accellary to the imagination. An early and partial cultivation of this faculty is an earl pregnant with fo much mischief, that it cannot be too severely deprecated. To it are we indebted for those thousand extravagancies in opinion and in conduct, which extort the pity of the wise, and the centures of

the fevere. To it we owe the motley abfurdities, which, under the name of Novels, deprave the taffe, and corrupt the affections, of the youthful heart; and in the early incitement that is given to the imagination, while judgment is fuffered to lie dormant, we fee the reafon why fuch books are read with avidity and delight. A predilection for the wild and extravagant must be the inevitable consequence of introducing trains of thought, made up of unnatural combinations, at a period when the mind has obtained few accurate ideas, and the judgment has been but little exercised.

The imagination that is not regulated by judgment, is pernicious in exact proportion to its strength. It presents to the mind's eye a false glass, through which no object is seen in its natural size and just proportion. All is distorted; though, by the glare of false colouring, the deformity escapes detection. Thus, by injudicious management,

is that faculty which, under proper regulation, is the ornament and bleffing of our prefent state, converted into a source of error and delusion. Thus what was intended for our happiness is rendered productive of misery, and confusion is introduced into the works of Gon!

Nor is the partial cultivation of the faculties confined to talle and imagination. Upon a strict investigation of this important fubject, I am atraid we should find, that it is no uncommon thing to attempt the cultivation of the realoning faculty without having paid any regard to the culture of those by which, in the order of nature, it is preceded. Have we no abstract reafoners who shew a deficiency in judgment? No metaphyficians who betray the absence of that common fense which has found judgment for its basis? Is it not to the neglect of the judging faculty, that we must attribute the favourable reception which the crude dreams of speculative visionaries

meet with from the young? How should they detect sophistry, whose minds have never been exercised on truth?

Where the judgment has not been duly cultivated, it is in vain that we endeavour to lead the mind to general reasoning; on fuch minds the sciences, that afford the most powerful aid to the faculty of abstraction, are lost. Those who know what affistance is to be derived from a knowledge of mathematics in this particular, are apt to envy fuch as have been favoured with of science totally thrown away! By how few is it made use of as a means of further improvement! Without the cultivation of judgment, the means will ever be rested in as the end. The knowledge of various languages opens a rich and inexhaustible mine to the cultivated understanding; but if judgment do not lend its affiftance, the ore will never be extracted. While we devote

devote the most precious years of life to the study of languages, it is surely proper to take some precautions against the possibility of so much pains proving utterly abortive. Let it be remembered, that to be able to confirme Greek and Latin is one thing, and to be inspired with a taste for classical literature is another. The first, you will perhaps by its surficient to qualify your sons for the professions to which you destine them. For who, in any profession, ever rose to distinguished eminence without taste and judgment?

Is a taste for classical literature acknowledged to be an accomplishment worthy of
a gentleman? Do not flatter yourself that
it will ever be acquired, without accuracy
of conception, and foundness of judgment.
Nor will these be sufficient, if pains be not
at the same time taken to fix such affociations as may introduce habits of thinking
favourable to the cultivation of sentiment.
How much this is attended to at great seminaries,

minaries, I leave it to parents to enquire. Let them reflect on the nature of the human mind, and confider which of its faculties are likely to receive improvement, where hundreds of bad and good are promifcuoufly mingled. Where the time of boys is fo entirely at their own disposal, that of the four-and-twenty hours but two or three at the utmost are spent under the mafter's eye; of the remainder, when we deduct what is employed in the important. business of purveying, in quarreling, and in play, we shall find little left for the purpoles of voluntary improvement. But unless much previous pains have been beflowed, how can we expect that boys completely left to their own disposal, goaded to idleness and diffipation by example, incited by the fame means to fenfual gratification, and destitute of guide or monitor, should voluntarily betake themselves to improvement? Such inflances are, I believe, fufficiently rare; and wherever they occur,

we may be affured that the foundation had been laid at home. Where this is wanting, all that can, from the nature of things, be acquired at school, is merely a verbal knowledge of the languages. The mind will not certainly at this active feafon remain stationary: it will be sharpened by fuspicion; its fagacity will be called forth by selfishness; and the experience of fraud, deceit, and perfidy, will give a premature existence to the feelings of indignation, jealoufy, and revenge. It is therefore evident, that where boys are to be fent to great schools, an uncommon degree of previous pains is neceffary, in order to fecure them from all the fatal confequences of fuch a plunge, and to enable them to reap all the benefit which fuch inflitutions are

If, in analyfing the faculties of the human mind, we find that Providence has made a manifest distinction betwixt the sexes, by leaving the semale soul destinate

of any of the intellectual powers, it will But if, upon enquiry, we find that no fuch partiality has been shewn by Heaven; it is incumbent upon us to confider, by what right we take upon us to despife the gift of God. When we neglect the cultivation of the faculties which He has fo gracioufly bestowed, can we flatter ourselves that we aft in concert with our Almighty Father? Let us examine the mode of education adopted at our great boardingschools, and fay, which of the faculties of us reflect on the manner in which education is too often conducted at home, and pronounce how far it is calculated to bring to perfection those high intellectual endow-Could it be proved, that the rational fathat the duties to which they are called, as intelligent and accountable beings, as

daughters, fifters, wives, mothers, and members of fociety, could be equally well performed by means of those powers which they have in common with the brute creation; then might the higher faculties of the foul be neglected with impunity.

To the wretched beings who are deflined to be flut up in the zenanas of Eastern despots, reason would be not only an useles, but a cruel gift. The accomplishments, however superficial, which can help to amuse the listless hours of hopeless captivity, ought by them to be prized as a resource from wretchedness. Considering themselves in no higher light than as mere objects of sensual appetite, it is to this point that their whole endeavours will necessarily be directed.

[&]quot; Bred only and completed to the tafte

[&]quot; Of fretful appetence-to fing, to dance,

[&]quot;To drefs, and troll the tongue, and roll the eye-

[&]quot;Yet empty of all good, wherein confifts

[&]quot;Woman's domestic honour and chief praise."

Such education to women fo deflined is perfectly appropriate; and the fole inconfishency which we can detect in the Eastern fystem, is in permitting their fons, as well as daughters, to pass the most important period of youth under the tuition of such degraded beings. By them are the feeds of moral depravity effectually sown; and sloth, and ignorance, and pride, and felf-importance, with every species of corruption, become the inheritance of the children committed to their care. Such are the consequences that must necessarily follow, when those who are destined to instruction!

Where the chief aim in education is directed to any other point than the improvement of the intellectual and moral powers, an artificial character will be produced, which, neither guided by reason, nor inspired by any noble or generous sentiment, will be the mere puppet of opinion, and the creature of imitation. But if imitation is made to supply the use of reason, is it probable, that the early associations will be such as to lead the mind to chuse the brightest patterns of virtue? Alas! experience has fully proved the contrary. Experience shews us daily examples of the satal consequences of carrying the system of zenana education into practice, in a country where women are called to act an important part on the theatre of society. Without intelless there can be no principle, and without principle there can be no security for virtue.

In order to cultivate the intellectual faculties to advantage, it appears to me, that we ought to accompany Nature in her progrefs; and as the gradually unfolds the powers of the mind, that we should devote ourselves to the improvement of each faculty, in the order it is by her presented.

Affuming this as a principle, I shall proceed in the following Letters to examine, in the first place, the faculty of Percep-

TION; fhewing the advantages that are to be derived from its affiduous cultivation, and the very great difadvantages that accrue from its neglect.

ATTENTION is the next fubject that will naturally fall under our confideration. I shall be at some pains to illustrate its importance; and shall not seruple to advance upon it arguments which appear convincing to my own mind, though they are unsupported by the authority of others. If they are founded in truth, they will stand the test of investigation; if otherwise, I should be forry to protract their fall.

Conception is the next faculty brought forth by Nature. By conception, I mean the ideas which we form of abfent objects of fenfe, or of our past fensations. So much depends upon the vigour of this faculty, that I cannot be at too much pains to inculcate the necessity of its being cultivated with never-ceasing vigilance. I shall, therefore, do all in my power to urge

the careful cultivation of this faculty, by an explanation of the important confequences to which it leads; and shall give you such hims with respect to its improvement, as, I hope, may be found of use to those who are concerned in the practical part of education.

The faculty of JUDGMENT is the next that will demand our attention. I shall trace its progress from its first dawn in the infant mind to its maturity; and though conscious that my abilities are inadequate to the magnitude of my fubject, I shall do what in me lies to enforce its importance. To the neglect of this faculty, all the follies, and many of the vices, which abound among us, may be fairly traced. Where the judgment is found and unperverted, the unruly defires and affections will not revel without control; but in order to the cultivation of found judgment, it is not only necessary that the affections be uncorrupted, but that they be early engaged on the fide of truth. Having

Having dwelt at large on the cultivation of Judgment, we shall then proceed to an examination of the faculty of ABSTRAC-TION. This faculty, though common to all, and susceptible of great improvement, is feldom cultivated to any perfection, but by the few whose course of studies has led them to cherish a turn for speculative enquiry. If general reasoning were indeed useful to none but the philosopher, we should leave the philosopher to enjoy it as his peculiar prerogative. But if it can be proved to be no less necessary in the conduct of life than in the speculations of philosophy, it becomes our business to endeavour to find out the means which are best adapted to its improvement. These the circumfcribed limits of my present plan will not permit me to explain at large; neither are my abilities equal to fuch a task: but having proved the advantages which refult from the cultivation of this faculty, the hints which I shall offer, may be

fufficient to direct the mind in fearch of higher guides.

Subsequent to Abstraction I shall place what offers upon the cultivation of TASTE and IMAGINATION, because the faculty of Abstraction is necessary to both. A few hints concerning the necessity of cultivating the power of Reflection will conclude the series.

And now, my friend, that I have laid before you a compleat view of the plan which it is my intention to purfue, you will be able in fome measure to decide upon its propriety. Where I fail in the execution, candour will make allowances for the imperfections of one who makes no pretensions to superior abilities. Placed by Providence in a situation undisturbed by the preffure of life's cares, tho'by an experience of its sufferings called to ferious reflection; bleft with leisure, and early inspired with such a taste for enquiry as gives that leisure full employment; I should have deemed

myfelf highly culpable, if I had declined the task to which I was called by friendship, and urged by the hope which is dear to every generous mind—the hope of being in some degree useful. The arrogance and ambition of a dictator are alike foreign to my heart. But to be an humble instrument in rousing my sex from the lethargy of quiescent indolence, to the exertion of those faculties which the bounty of a kind Providence has conferred; to be the means of turning the attention to those objects which tend to the progressive improvement of the human race; is a species of glory, to which, I confess, I am not indifferent. If in this way

"To covet honour be a fin,
"I am the most offending foul alive."

But left I should be tempted to further egotism, I haften to affure you how much

I am yours, &c.

LETTER II.

PERCEPTION.

Progressive Development of the Faculties.

Perception explained.—Hints towards its
Cultivation in early Infancy.—Its Connexion with the benevolent Affections.

MY DEAR FRIEND,

THERE is no subject more curious in its nature, or that can possibly be more universally interesting, than the manner in which Nature operates in the developement of the rational faculties of man. The slowness of the progress is apt to excite our impatience; while, in fact, it ought to call forth our highest admiration.

A curfory view of what a child acquires in the first two years of its life, will con-

vince us, that were the faculties to open with a rapidity equal to our wishes, the powers of the mind would counteract each other in fuch a manner as effectually to prevent their ever coming to perfection. Happily, Nature at that early period prefents an insuperable bar to our attempts of improving upon her plan. We may indeed counteract her wife defigns, by retarding the operation of those faculties which the has then produced, and on the exercise of which depend the strength and vigour of the future powers; we may frustrate her plan, but we cannot accelerate it. It is not that we fet about this vain attempt; then we fometimes do fet about it in good earnest, and infift upon the powers of imagination, judgment, and reflection, coming at our call, like the spirits of Glendower

[&]quot;But do they come, when you do call them?"

Alas! we trouble not ourfelves to observe whether they do or no. It is sufficient that children learn to prace by rote upon subjects which require the powers of judgment and reflection to comprehend. They repeat the ideas of others, and we are fatisfied, without taking any account of their own flock.

It is thus that predigies are formed; all of which, as far as I have been able to observe, are a species of forced plants, that upon a slight view appear fair and sourthing, but have benther strength nor slavour.

Soon would the navy of England cease to be our pride and boalt, if it were built of timber from the hor-house. But although an attempt to force the growth of the saping would be detrimental to its future drength, pains must be bestowed in removing all obstructions that might check its rife; its roots must have room to shoot, or its branches will never expand in blooming verdure. A finillar attention to

the mind, in the early period of existence, appears to me to be effential towards the expansion of the intellectual powers.

I have already observed, that the faculty of Perception is the first which opens in the human mind. Though Perception is a word derived from the operation of but one of the sense, it is here applied to denote the impression made upon the mind by all the objects of sense. The meaning of it, as thus applied, must be understood by every one who reslects on what he does, when he hears, sees, feels, &c. "Who-" ever reslects," says Locke, "cannot miss it; and if he does not reslect, all the "words in the world cannot make him "have any notion of it."

The word Perception is likewise frequently used in a figurative sense.* But the least intelligent person must perceive the difference between perceiving the let-

^{*} In this fense, also, do I use the word Impression, whenever it is applied to denote mental operation.

ters upon this paper, and perceiving the routh of a proposition. The perceptions of an infant are equal to the one; conception and judgment are necessary to the other.

Nor is this all. As the knowledge all our intellectual improvement, we may belief, that those who are born deaf or blind, are perfons of uncommon endowfions received from the remaining fenses ception; and if it further appears, that my idea of the advantages to be derived from an attention to the improvement of fancy, can neither be deemed chimerical

"They have eyes and fee not, cars have they and hear not," is an emphatic reproach

justice of this remark. (B)* Were it, however, never applicable to any but those of the lower orders, it might here be passed over in silence; but alas! accurate observation is not always the concomitant of rank. The lie of the day in the upper circles does not always originate in malignity; many are the slanders, many the falshoods, that originate in that consustion of ideas, the foundation of which is laid in the habit of inaccurate perception.

Befides its baleful influence on the moral character, there is another evil arifing from this habit of inaccuracy, that deserves our most serious attention.

Every science which the human mind can pursue, every study in which it can engage, demands, as a preliminary, an attention to the objects of perception. In proportion as this attention has been rendered habitual to the mind, from the earliest stage of life, will the rudiments of science

^{*} See Note fecond at the end of the volume.

child who has been accustomed to pay of ideas which are ready to be brought affift the mind in forming new conceptions. henfible neglect of their parents, or from have never made this improvement of their perceptive faculties, are, and neceffarily must be, slow in comprehending any fubject. They want, as it were, the first link of the chain, and have nothing whereon to fasten the new ideas with

That this apparent dulness is frequently nothing more than the total disuse of that faculty of Attention, without which, though the five fenses be possessed in full perfection, there can be no Perception, is evident from this circumstance, viz. that when

fuch children have their perceptions quickenced by attention, this apparent flooldly gradually clears away, and the interection faculties appear often flrong and vigorous. If, however, children of this defeription, whose perceptions are either dull bynature, or blunted through want of exercise, and who have consequently no stock of ideas, have information forced upon them; it is ten to one, that they will conceive such a distille to learning, as will make them continue dunces for ever.

That it is by means of the lenfes that ideas are first acquired, is a Lact, which, I apprehend, to be now established beyond the reach of controverty. It has, for more than half a century, been generally admirted by philosophiers; but the belief of it has, as far as I know, induced little additional attention two which the knowledge acquired by the fenfes first begins to be communicated to the injud. The reason of this acgled is obvious. Mo-

mory extends not to those years of child-hood, when our first ideas were acquired. We can recollect the period when knowledge was first communicated to us by others, but of our previous conceptions we have no remembrance. We therefore look upon those first years as a fort of blank in our existence, and naturally consider them as the same with regard to our children. All our pains, all our attention, with respect to their minds, is therefore reserved for that period, when we think it propers, there, according to customs, they should begin to receive instruction.

It is no uncommon thing to fee a mather, who has never affifted her child in the acquirement of a fingle idea during infancy, expressing the utmost anxiety for its learning to read. As soon as the age for tasks arrives, tasks must be given, or the child is lost! Thus is an invincible aversion to learning often inspired; while if the tenth part of the pains then bestowed had been

given at a more early period, curiofity would have been awakened, and the mind would have been prepared for the reception of farther inflrudtion. The feed that is to bring forth an hundred-fold, must be fown in good, and in prepared ground.

Let us now take a view of the manner in which the infant faculties unfold. It is probable, that as from as a child is capable of fixing its eyes upon an object, it acquires fome idea of the object it beholds. There mult be for a considerable time very confuled, the very name of Mance-being one that is acquired by the mind, and not the natural confequence of fight. To a child, or to a grown person born blind, but who has by an operation been reflored to fight, every object appears to prefs upon the eye at an equal diffance; * nor is it till experience

The time may be observed in all other animals. I remember being once greatly surprised at seeing a young puppy, which I had put upon the table, deliberately put its put over, and consequently full with violence upon the floors I then auribated this to want of

has taught the contrary, that either the child, or the relieved person, can be convinced of it. This acquired perception is very gradually attained, and probably remains imperfect till the child can run about; nor does it then extend to diffant objects, few children of five or fix years old being capable of making any difficient betweet an object that is only half a mile, from these that are four or five miles diffant. The fame may be observed of people brought up in towns; many minibarants of the city of Lendon, in respect to the perception of the diffance of remote objects, remain children dining life.

Ideas of the diffance of objects can only be obtained by experience; but the means

fends. But an explanation of the theory of whom conviocal me, that the paper did not perceive the carpet as a different object. Were man to gain the old of his legs essenting specied of the line as the four-librard ammals do, to what amount with dangers would help esponent In this, as in all the tord mores of Nature, we for the wildom and the geodation the Great Creator.

of our children's experience are on one hands. When a child of five or fix months old fixes its attention upon any object, it oughts to be induced to view it at every different degree of diffance, to examine it near, and to look at it for of; and thus, by degrees, ideas of Perception will be acquired. By some pains taken to fix these ideas in the mind, during the first two years of life, many fatal accidents might be prevented.

From the want of experience, our own notions of perpendicular unlance, as far as they are obtained from the eye, are imperfed. No worder, then, that children should be liable to so many fatal mistakes concerning it. When a child's first notions upon this head are obtained by means of a severe fall, it is apt to produce a bad effect upon the mind, by inspiring that terror, the consequences of which I have already explained at large. This passion, as I have formerly shown, continues to operate

operate upon the mind by means of affociation, long after the cause that first produced
it is forgotten. I have known people who
dared not look down a precipice; nay
some who dared not look from a high window, though perfectly conscious of their
security. Is it not probable, that these
sales shave originated, either in some
strong impression of terror, (the circumstances attending which may be beyond
recollection) or in false notions of perpendicular distance, given by a foolish nurse, by
way of keeping her charge from danger?

As foon as the light is perfect, it must behold the objects before it. But it is not, till capable of some degree of attention, that a child can have what I call a perception of the object. This faculty of attention begins to display itself about the third or fourth month. In thriving, lively children, it is about this period very perceptible. Delightful it is to observe this dawn of intellect in the little innocent. Caught by

fome lively colour, fome gay appearance the eye fixes in eager though fibort-lived examination, commonly ending in a crow of delight. The tone of nature ought then to be followed. Let the little enterture he danced and toffed about, till both you and it are tired. But when again in grave looks denote a fixed attention, let neutenfe, I befeech you, have a truce. Let the Gernal bunch of keys he ftill; not endeavour, by ill-judged interruption, to break the fhort reverie; but rather, by fubmitting, if possible, the object of attention to the touch, give two fenses an opportunity of judging, instead of ones.

At two months old, a child is evidently capable of diffinguiling betwint a white ball, and a black or brown one. But its perceptions must have been further opened, before it can observe any difference betwint a ball covered with white leather, and one of ivory. Every diffinition which the mind can make, you may reckon a new

idea acquired. It is in your power to multiply these ideas at a very early period. It is likewise unfortunately in the power of a foolish nurse to retard the natural presents of the mind, by perpetually interments its attention. A child that is much danced about, and much talked to, by a very lively nurse, has many more ideas than one that is kept by a filent and indoless person. A nurse should be able to take nonsense in abundance; but then should be able to know when to stop.*

Good temper and activity are such indifentable qualities, that if either be wanting

^{*} It has been observed to me by a Lady, who to uncommon sense and penetration has united the advantage of much practical experience, that nothing tends more effectually to retard the progress of the infant faculties, than a custom prevalent with nurses, of keeping the child in a perpetual trot upon the knee. Does the poor infant fix its attention upon an object? the knee is immediately in motion to prevent the possibility of its acquiring any idea from it. Does it shew symptoms of displacency or distress? the trot goes on with redoubled velocity, till the little creature is stupified into filence.

A misfortune opposite to what has been above alluded to, is sometimes the confequence of an unusual flow of animal spirits in infancy. I mean the less of the capability of

AMARKA SE

attention. This, I believe, always proceeds from improper management in very early life; for the most lively infants make the most early display of the faculty of attention, and would no doubt continue to exert it on the objects of perception, if they were not injudiciously diverted from the attempt.

The more lively the flow of ideas the more ftrongly is the mind impelled to increase their number. Hence proceeds that curiosity fo remarkable in children; an engine more powerful in the hands of judicious parents than the boasted fulcrum of the Syracusan philosopher. To direct this curiosity into proper channels, ought to be the unceasing object of parental care, from the dawn of intellect till its maturity. In early infancy, it must be exclusively directed to the acquirement of clear and distinct notions of the objects of perception.

As foon as children acquire the use of speech, we may observe their number of ideas to increase with astonishing rapidity.

VOL. 11.

As letters, when arranged upon paper, become the figns of words, fo are words the figns of ideas; and as in acquiring the knowledge of letters, we must learn to associate the idea of the sound of each letter with the written character, so in acquiring the use of words, we must associate the sound of each word with the idea it is meant to express. When we give a due degree of consideration to this curious sast, we shall be associated at the number of words which a child of three years old has acquired!

Let us fee how many powers of the mind are necessary to the acquirement of every word which is the fign of a distinct idea. There must be, in the first place, a distinct perception of the object, which could never be obtained but by the exertion of the faculty of attention; secondly, it must have been an object of conception; thirdly, of memory; fourthly, a considerable degree of judgment must have been

exerted, in difcriminating the particular found expressive of the idea; and fifthly, that found must have been connected with the idea by the laws of affociation. Before the child can have pronounced the words mamma, papa, chair, table, &c. with appropriate meaning, all this intellectual process must have been gone through. How abfurd is it, then, to imagine that this period of life is worthy of no attention! If the use of speech be, and to me it appears evident that it is, a means of facilitating the acquirement of ideas, fome pains ought to be bestowed on the attainment of distinct articulation. It has been observed to me by a judicious friend, that children are greatly affifted in this process by teaching them, as foon as they acquire the use of speech, distinctly to pronounce the letters of the alphabet. This is feldom thought of, till children are taught their letters; their articulation is confequently feldom distinct till that period; and it may be obferved, that the articulation of those who never learn to read, is feldom distinct through life.

The impressions made upon the mind through the medium of the fight are, I believe, the chief fource of ideas in the period of infancy. That they are not, however, the only fource, is obvious from the attention which children pay to found: and I am led to believe, that every thing which has been faid to prove the possibility of improving the perceptions of children with regard to objects of fight, may likewife be applied to the perceptions of found. As people who are bleft with good fight, must, when they open their eyes, of necesfity fee; fo must all who have the organs of hearing perfect, of necessity hear every noise that is made beside them. But as an object must be surveyed with some degree of attention, before it can properly be faid to be perceived; fo must a found be liftened to with fome attention, before its degrees of intonation can be discriminated. A person who has no ear for music, hears the sound of a violin as well as the most critical connoisseur: the noise made upon the instrument is equally loud in the ears of both. To the one, it is a continued and irksome noise; to the other, when touched by a masterly hand, it emits sounds expressive of all the sentiments that can be felt by the human breast—now elevating the soul with emotions of sublimity, now melting it into tenderness. The sense of hearing is in these two persons equally acute; whence, then, proceeds this amazing difference in their perceptions?

An examination of the faculty of attention may, perhaps, give us some affishance towards the solution of this difficulty; though the fuller explanation of it must be reserved for the Letter on Taste. Where the organs of hearing are perfect, I believe, it never happens, that a person who has been early accustomed to pay attention to

mufical notes, is found incapable of discriminating betwixt grave and acute founds, or of marking the number of notes in a bar, which conflitutes what is called Time. This is the work of attention. The pleafure derived from mufical composition has another source. It is an emotion of taste; and under that head we shall examine it.

Some children appear to have much quicker perceptions than others. Where this faculty appears weak, great pains ought to be taken to invigorate it. The mind ought to be won to the examination of objects by every engaging art; nor should it be suffered to rest satisfied with such a slight and superficial survey, as may convey a false impression. It is by repeated and attentive examination, that children learn to perceive the difference betwixt inanimate objects which are put in motion, and sensitive nature. Without some pains bestowed in teaching this distinction, children either learn to attach ideas of

animation to mechanical motion, or of infensibility to all living objects, that are inferior to the human fize and figure. The first is the cause of a thousand foolish terrors, and the latter leads to many infant acts of cruelty. I have seen a child assaud of the wheels of its little chaise, when it saw them put in motion; and known the work of a great clock, or the striking of a a great bell, excite emotions of terror to an advanced period of life. Had the perceptions been in infancy exercised in examining the nature of objects, these false fears could never have been engendered.

On the other hand, if a child has not been accultomed to examine living objects, and made fenfible that every thing which lives has fenfation; it may amuse itself with torturing the inferior animals, till habits of cruelty are deeply implanted in the mind.

So nicely interwoven are the moral feelings and the intellectual faculties of

man, that it is impossible effectually to improve the one, while the other is neglected or destroyed. In the cultivation of the perceptive faculties, we lay the foundation for that quick differnment, which is equally necessary in acquiring just notions of things, and in diffeovering the true path of moral rectitude. By the neglect of these faculties we not only enseeble the understanding, but lay the foundation of those faile associations, which extend their baleful influence to the affections of the heart.

As it is by means of Attention only that the perceptions can be improved, I shall proceed to a more minute examination of this important faculty in the following Letter

Farewell.

LETTER III.

ATTENTION.

The Power of Attention in improving the Perceptions.—The Velocity of its Operation so great as to render it frequently imperceptible.—The Influence of the Passions upon Attention.—Illustrations by Example.

MY DEAR FRIEND,

TO impress a conviction of the necessity of cultivating the faculty of ATTENTION, nothing more is necessary, than to demonstrate its being effential to the operation of every other faculty.

The fenses are the organs of information to the mind; and upon their evidence the learned and the vulgar rely with equal

confidence.

confidence. Yet the clearness, and, in many instances, the truth of their evidence, depends upon the degree of attention that has been exerted. Where the exertion of Attention has been habitually neglected, the senses lose their vigour, and the perceptions become languid and confused; but where, on the contrary, the perceptions have been exercised by attention, they acquire new strength, and are brought to a degree of perfection, which, in some instances, appears quite extraordinary.

The truth of what is here advanced will appear beyond all dispute, when we consider, that people, who, from their peculiar avocations, as hunters, failors, &c. are habitually intent upon distant objects, become

^{*} It may be observed, that the lower order of fervants frequently appear dull of hearing; and that without any defect in the organs of vision, they often do not see the objects before them; nor, till considerable pains have been taken, do they perceive minute differences with regard to the fize and colour of objects, or whether they be straight or crooked, &c.

capable of distinctly discerning objects at such an immense distance, as totally removes them from the fight of such as have never been accustomed to make similar observations; while, on the other hand, those who have from early life been accustomed to examine minute objects near the eye, frequently become purblind. This defect evidently increases with the increase of luxury, which draws people together into cities, where children are brought up in ignorance of all the sublime objects of nature, and have their sense of sight perpetually occupied in a narrow sphere.

I am aware of the objection that may be here started, on account of the formation of the eye; from which it appears, that short-fightedness must be the inevitable consequence of a certain degree of convexity. But why is this convexity confined to people in certain situations? Why does it only appear in those whose pursuits and avocations demand minute attention?

To a natural defect in the organs of vision, the child of the peasant is as liable as the child of the prince; but seldom shall we meet with a short-sighted person, who has been from infancy accustomed to the observation of distant objects in the country. Does not this evince the wonder-working power of Attention?

Those who enjoy the bleffings of fight and hearing, receive through the medium of these senses for much information, that they pay little attention to the sense of seeling. But when a person is deprived of sight, this sense becomes so necessary towards the acquirement of ideas, that the attention is to make it appear to the vulgar like the acquirement of a new sense. The skin of my hand is as sine, the nerves are as exquisitely susceptible, as any blind person's whatever; yet on seeling the sheet of paper on which I write, with the utmost attention of which I am now capable, I

cannot perceive any difference betwixt the part that is written, and the remainder of the page; yet this, I know, would have been instantly distinguished by a blind lady with whom I was formerly acquainted. So exquisite had the sense of feeling in this lady become, that I have feen her thread a fine cambric needle with the utmost ease, the aperture of which could fcarcely be discerned by my eye; and so acute was her perception of quantity, that in running her hand along the front wall of a new apartment, the inftantly discovered an error in placing the windows, which had totally escaped every other person. From this, that by Attention the fense of touch might be made much more useful to us than it

The fense of Taste is originally equal in the peasant and the voluptuary. In the peasant, it remains through life simple and uncultivated; but in the votaries of luxury,

it is, perhaps, the only perception that is faculties. Is it not, then, lamentable, to fo exclusively directed to the cultivation of this fense? The person who cannot distinguish the difference of colours, must necesfarily have indiffinet conceptions of particular species of beauty. He who cannot extend his observation to distant objects, must have his stock of ideas proportionally limited; but though a man should not be able to distinguish betwixt the different tastes of parsnip and of turtle, the number of his ideas of reflection will fuffer little diminution. The fame attention that is bestowed in acquiring this delicacy of perception with regard to the palate, would, in an equal degree, increase the perceptions

from all the other organs of fensation. And the only reason why the habit of Attention is more easily acquired in the one instance than in the others, is, that Attention is in the one case stimulated by appetite, while, in the other, it has no such stimulus.

This naturally leads us to confider the operation of the passions upon the faculty of Attention. This operation I conceive to be mutual; the passions rouse attention, and attention increases passion by a fort of re-action.

By Attention the existence of every paffion is prolonged in an unnatural degree. Wherever the attention is necessarily divided betwixt the object of passion and other objects, its force soon diminishes. No person, who is under the necessity of earning a subsistence, is in any danger of dying either of grief or love.

Where felfiffness predominates, we shall find the attention perpetually alive to every minute circumstance, that can in any wife

affect the eafe, health, or comfort of the person concerned; while that which affects the eafe, health, or comfort of others, is totally overlooked. Where the attention is thus exclusively turned to felf, it never fails to create a fusceptibility of feeling, which deceives the mind into an opinion of its own exquisite sensibility. But what is the fenfibility, that is not under the influence of benevolence? Let those who pique themselves upon the possession of this amiable quality, try it by the test I have given. Let them observe, if their attention is as much alive to whatever can affect the feelings of others, as to whatever even remotely concerns themselves. Let them estimate their feelings by the manner in which they feel for the trouble and uneafiness they create to those around them. If attention be turned to leffen this trouble, and to alleviate this uneafinefs, with as much ardour as it is engaged in leffening and alleviating what comes

home to felf, it will produce that legitimate fensibility, which is born of benevolence. But where felf is the great, the only object of attention, fensibility and felfishness may be considered as fynonimous.

By the attention which a delicate flate of health demands, a disposition to selfishness is frequently produced. Another proof in favour of my argument, as it shews the power which attention has over the affections of the heart. When directed towards others by pity, love, gratitude, or any of the sympathetic emotions, it increases the disposition to benevolence. When exclusively devoted to the study of selfish gratification, it augments the spirit of selfishness. Hence the necessity of teaching children to pay attention to others.

I have, in the former volume, given some instances of the operation of selfishness in those who are the slaves of terror. Let us now observe the power of this passion in quickening the faculty of attention.

VOL. II. F The

The strongest facts brought forward by the advocates of natural antipathy all go knowledge of the prefence of the objects of their aversion. As for instance: a person who has a natural antipathy to a cat, will immediately discover when one is in the room, even though it should be effectually hid from his fight. The fame species of sagacity I once saw in a Lady, who had an antipathy to dead birds. Soon after entering the parlour of a friend's house, where she went on a morning-visit, fhe grew fick, and instantly declared that there must be a dead bird in the room. The bird-cage was immediately examined, and poor Dickey found dead at the bottom of the cage! I at that time became a convert to the doctrine of antipathies, and should probably have remained so ever after, had I not been led to reflect on the power of attention in the feeming improve-

ment of the faculties. On confidering this fubject, it appeared to me, that if the fense of feeling can, by the power of habitual attention, convey those nice perceptions of the furfaces of body, which, to people who have not thus exercifed their attention, appear aftonishing and incomprehenfible; why might not attention (ftimulated, as it must be in these instances, by the impulse of aversion) produce a like lively perception of fmell? That a perfon who has had his attention frequently thus directed, may be able to perceive a certain effluvia which escapes the observation of others, is no more extraordinary, than that colour by the touch.

I am too well aware of the tafte for the wonderful that prevails on vulgar minds, to expect any of that description to enter into this mode of reasoning. To minds of a higher order, therefore, do I now address myself; and sincerely hope I shall one day

tered upon and purfued by those who are equal to the investigation. To men of science who are intimately acquainted with the human frame, the fubject must be particularly interesting. (c)* It is they only who can determine, how far this power of attention may explain the apparent effects produced by charms, and all the long etcetera of fooleries, which have in every age abused the credulity of mankind .-Should it appear that the wonderful cures effected by animal magnetifm, tractors, and fuch like inefficient causes, may really be explained by the phænomena of attention, it will tend to raife the importance of our present subject. And I confess, I am the more fanguine on this point, upon confidering that the efficacy of all these wonderworking charms feems entirely to depend on the attention of the public; and that, like the hysteric fits of fine ladies, they

^{*} See Note at the end of the Volume.

cease to operate, the moment they cease to be observed.

Attention is not only necessary to the improvement of our perceptive, but is effential to the operation of all our intellectual, faculties. How much memory depends upon it, is known to all. By habitual exercise its operation becomes so quick, as to require, in some instances, no inconsiderable degree of reslection, to make us fensible of its having actually been exerted.

Professor Stewart, with that enlightened penetration which characterizes all his observations, has traced the operation of attention in some of those actions, which philosophers had formally confidered as mechanical. He has, I think, most fatisfactorily proved, that the most rapid performer in music must necessarily pay attention to every note he plays, though his attention is so evanescent as to leave no consciousness of its exertion.* I cannot pretend to improve upon his illus-

^{*} See Elements of the Philosophy of the Human Mind.

trations; but I may be permitted to give an example more familiar to my own fex, than those which he has adduced.

You, I know, can knit; and can do it fo well, that you may have forgot the process of learning it. Take then one of your children, who knows nothing of the matter, and in teaching her, you will obferve the difficulty of the operation. The position of the needles must first be attended to; then the thread must be twisted round the proper finger; then the stitch must be lifted by the needle; then the fore-finger of the right-hand must cast the thread round the needle, which must then be returned through the flitch; and finally, the stitch must be gently dropt by the needle in the left-hand, without injury to the reft. Every one of these operations requires a feparate and fixed attention; and yet by habit they come to be performed fo rapidly, that we appear to give them no thought. By habit I can perform all these operations,

while

while reading a book that feems to require my whole undivided attention. According to the opinion of the juffly-celebrated Hartley, my mind has now no concern in this process. He would fay, that the motions of my fingers " cling to one another " in the way of affociation, the acts of vo-" lition (or will) growing less and less ex-" prefs all the time, till at last they become " evanescent and imperceptible." But that the attention is still, however imperceptibly, engaged, is evident from this. that the moment I drop a stitch, it is taken notice of; and that, however deeply engaged in my fludies, I do not forget to turn the stitch that marks the seam at every

Should any grave philosopher deign to look into these pages, I will permit him to smile at this simple illustration, which he may, if he pleases, call, argumentum ad feminam; but if it aid my design of exhibiting the power of attention, as effential in

every voluntary operation of mind or body, it will fully answer the purpose for which I intended it.

The great object of this imperfect, tho' perhaps too tedious, examination of the faculty of Attention, is to impress a conviction of the necessity of its early and affiduous cultivation. In this we are happily affifted by that curiofity, which even in the dawn of intellect is obvious in the infant mind. When this curiofity calls forth attention, let us not counteract the wife defigns of Nature; let us rather be affifting in bringing to perfection the plan which the has in a manner sketched. In the examination of fenfible objects, let all the fenses be duly exercised, that the indistinct ideas received through the medium of one of the fenfes may be fully cleared and explained by the others.

Here is a ball of white cotton, there is one covered with white leather, and there another of ivory; not only fight, but feeling, and hearing, must be exercised, before a child can discriminate the properties that constitute their effential differences. In doing this, how many powers of the mind must be employed, in all of which attention is implied as an effential?

As the fphere of observation enlarges, the objects of attention multiply on every fide; upon thefe the judgment now begins to be frequently exercifed, and the rudiments of invention appear. The most effectual aid which we can give to the progress of these powers, is to provide for their proper exercise. The child who is for ever cooped up in a nursery, and who has no other objects whereon to exercise its curiofity and attention, fave a few pretty painted toys, will foon have its curiofity checked, and its power of attention weak-In these circumstances, neither judgment nor invention can be expected to display themselves at an early period. They are both constantly anticipated by the

provident care of the attendants, in whom it would be a breach of duty to let little mafter have the trouble of acting or thinking in any instance for himself.

Nor where the circumstances of parents happily forbid the attendance of a train of mercenary mind-perverters, are the children always permitted to reap the advantage of their fituation. Too often have I beheld the budding intellect as effectually nipped by the injudicious anticipations of an indulgent mother, as it could have been by the most foolish nursery-maid. Children who are accustomed to this species of constant superintendance and prevention, have no inducement to the acquirement of those habits of attention, which I consider as the basis of all intellectual improvement.

"You can't open that pretty box, love; come to me, and I will do it for you. "See! what nice comfits there are in it!" The box is opened, the comfits are eaten, and mamma again ferews on the lid.—

Pleafed

Pleafed with the novelry, little mafter again defires to have it opened, and again she complies with his request. The request, or rather command, is again repeated, and complied with; till mamma grows tired, and then she declares that the naughty box will not open any more! The ill-humour which succeeds, is stifled by more comfits from her pocket, or the poor child is coaxed to resume the string by which the painted horse is dragged round the room. All this I have seen, and similar occurrences may be now in your recollection. Let us see how the same circumstance is managed by a judicious mother.

"Here is a pretty box, mamma; but it

" won't open, all that I can do."

'That box, my dear, won't open by force; the lid is fcrewed on, and it must

be turned in fuch a manner as to take

out the fcrew. Observe. There—it is

opened—now see how the part that fixes,

is cut in the manner of a screw.'

[&]quot; Oh, yes,

"O! yes, now I understand it; for I remember what papa told me one day about the cork-ferew, when I was looking at it: but I thought there was no

66 use of screws, but to draw corks."

All fcrews are made upon the fame plan, or principle, as it is called; will you remember that word?

"Yes, mamma; but what elfe is there befides cork-fcrews, and fcrew-lids for comfit-boxes?"

'Many things, my love, are made upon the fame principle. A piece of furniture that is just by you, is made upon the principle of the former of the principle o

the principle of the screw; and if you will find it out, I will give you a kifs."

"I fee! I fee! it is the flool on which "my fifter fits at the piano-forte. It turns and rifes just like the lid of this box."

This feene I have likewise witnessed. Does it require any argument to prove which of these children would be most likely to pay attention to the objects of

perception? Can we be at any loss to determine, which would be best prepared for receiving instruction at that period, when, in the minds of unthinking people, instruction commences?

As my portraits are all drawn from real life, I shall, if you please, take a view of two families brought up on the opposite principles I have here stated. The parents of each family were equally fond of their offspring. The children were equally promising; and, had the management of their early years been equally judicious. I have every reason to believe, that the intellectual endowments of the children of each family would have been much upon a par.

Mrs. X. was a domeftic character, was much at home, and always with her children. Unfortunately for them, she had conceived the idea that education was to be the work of their teachers, and that till they learned to read, they could learn

nothing. To keep them out of harm's way, to amuse, to feed, and to dress them, fhe confidered as duties; and piqued herfelf on giving up fociety in order to devote herfelf to their performance. For their amusement she spared no expence in the purchase of toys; her fitting-room was filled with the painted fragments of broken chariots and disabled horses. Fresh toys supplied the place of those that were demolished, and one of the active powers of the mind was thus brought forth in the love of novelty. This short-lived passion was fucceeded by fatiety, and fatiety by difguit. If ever curiofity appeared, it was immediately repreffed by those foolish anfwers to every enquiry that are thought fo proper for children.

At length the appointed period for learning to read arrives. Induced by the pretty book, by novelty, and the reward of fugar-plums, the child gets acquainted with its letters. Novelty then ceases to ope-

rate; the pretty book has loft its charms, and fugar-plums are no rarity. No matter; the leffons must go on in regular course. The poor child, who never from the hour of its birth has had its attention exercifed upon any object whatever, must now attend. Without any distinct idea upon any fubject, without any link in the chain of affociation, it must now learn to repeat words that are fet down for it. It has no curiofity to be gratified; nor, indeed, is curiofity endeavoured to be excited. But as all little mafters and miffes of fuch an age learn to read, it too must learn at all events. What is the natural confequence? The child acquires an insuperable aversion to reading, which long operates as a bar to every improvement. That this really happens, I can aver from actual experience; having known a child exactly thus brought up, who, at nine years of age, would grow pale at the fight of a book, and at the propofal of reading would, by the fallen countenance and dejected eye, plainly evince the most deep-felt aversion.

In proportion to the vivacity or dullness of the power of conception, this aversion will be the more or less unconquerable. Where conception is languid, it will probably remain fixed for life; and the only reading that people of this description will ever take to, is works of fancy. In those the languid imagination is aided, indolence is gratified, and the mind that is incapable of combining images for itself, enjoys a fort of childish pleasure in surveying those that are held up to it by others.

Let us now turn to Mrs. Z. the mother who taught her fon the properties of one of the principles of mechanics, in unfcrewing his toy. In this little incident, an example has been already given of the method she took to call the attention of her children toan accurate examination of every object that came within the sphere of their observation. Every field slower which

they gathered in their walks, every pebble which they picked up in the road, was a fource of new ideas to their tender minds. Curiofity was thus awakened, turned to its proper objects, and so judiciously gratified, as to lay the foundation of a love of knowledge, the first step to all improvement. Reading was taught with ease, and confedered by the children in the light of a privilege, rather than a task. To keep the desire of information alive in the actual curiofity was often, but partially gratified, and full information referred to the period when the children might themselves acquire it from books.

How effectually the love of reading may be thus infpired, will appear from the following incident:—The eldeft little boy of a family brought up exactly as I have described, when about nine years of age, was put to fleep in a room where some old books were kept in an open closet; among these was Pope's translation of the Iliad, vol. II.

which foon attracted the young gentleman's attention. So delighted was the boy with its perufal, that, as it afterwards appeared, he used to watch the first dawn of day, (and it was then the middle of fummer) take his book into bed, and read with avidity for hours before the family were aftir. This might never have been known, but for a query which he put to his mother, to whom he constantly applied for affistance in every difficulty. That which now perplexed him, might have posed more able critics; I shall give it in his words. " Pray, " mamma," faid he, " what was the reason 66 that Venus, who was quite a true goddess, " could not make her fon Æneas immortal; 66 while Thetis, who was but a fort of halfec goddess, could confer immortality upon 66 hers ?"

Do you not conceive, my dear friend, nay, do you not feel, how the heart of the parent must have thrilled at this proof of penetration and fagacity in her darling boy?

boy? What a charming opportunity of explaining the nature of fabulous poetry; of giving diffinct ideas of heathen mythology; and of impressing upon the mind a clear perception of the superiority of a sublimer system! In the hands of such a mother, we may believe that such an opportunity would not be lost.

You will, perhaps, attribute all this to the effect of extraordinary genius. That this child was not a boy of ordinary capacity, I must allow: but still I am of opinion, that had he been brought up from the cradle as the children of Mrs. X. were brought up; had his attention never been awakened to the objects of perception, had his early curiosity been repressed, and no affistance given to his mind in the formation of its ideas; his conceptions must have been necessarily so much less lively, so much less accurate and distinct, that his genius, at the time we speak of, would have been far from appearing extraordinary.

Far from confidering all to be born with the same degree of intellectual capacity, I believe there are different degrees of strength and vigour in the intellect as well as in the corporeal frame. But let not this analogy carry us too far; let us not imagine that the mental, like the bodily, powers, will expand of their own accord. Nature has provided for the preservation of a certain degree of strength, beauty, and proportion, in the species, by ordaining that where these are greatly desicient, the race shall foon become extinct; but the race of sools may, alast be multiplied without end.

The utmost care that can be bestowed on the improvement of the perishable fabric, can add but little to its strength; whereas the mind—the immortal, the imperishable part—is happily so formed, as to be susceptible of progressive improvement through the ages of eternity. The wisdom, the knowledge, of every generation is an accumulated treasure that de-

fcends to its posterity. We in this age are born to a rich inheritance; let us not, like prodigals, fquander it upon unprofitable trifles; let us rather put it out to interest, that the capital of the succeeding age may be increased. The furest method of effecting the increase of this intellectual stock is to lay a foundation for the improvement of the mental powers, by an attention to their cultivation from the earliest period of their existence. For this purpose we must observe, (and the observation cannot be too often urged) that the appearance of the different faculties of the mind is not fimultaneous, but progressive. We too frequently expect every thing from reason; but if the preparatory faculties are neglected, reason will never ripen to maturity. It is they which must afford the materials on which reason is to operate. Nature has afforded a fpace for their exercife; she has given time for their attaining some degree of vigour, before reason

brought forth. It is in not attending to her wife regulations, that all our errors in education originate. Let us fludy her laws, and in them admire the bleffed provision which the Divine Source of all perfection has made for the happiness and improvement of his rational offspring!

Before I take leave of this important branch of our fubject, I wish to propose to your consideration a few observations upon the nature of those trains of thought, which, from the first glimmerings of sense to the latest period of existence, slow through the mind in a never-ceasing current. Every article that composes this perennial stream, has been an object of previous attention; and from its prevailing materials, every person may, upon self-examination, learn to what class of objects the attention has been chiefly directed. Joy and grief, complacency and resentment, each introduce trains of ideas of correspondent complexion. While the mind is agitated by any of these

emotions, the attention cannot be turned to indifferent objects without a violent effort; and if these emotions frequently are introduced in early life, we need not expect that the effort ever will be made. Hence the importance of preserving the tender mind from the dominion of passion; hence the necessity of exerting our utmost endeavours to conquer in infancy those unruly desires arising from the gratification of self-will, which give a direction to Attention unfavourable to the culture of all the mental faculties.

If the trains of thought, which in our waking hours inceffantly flow through the mind, depend upon the nature of the objects to which we chiefly direct our attention, it appears of the utmost consequence to our fuccess in education, to turn the attention to such objects as may introduce trains of thought unconnected with any violent emotion. This is the great advantage of the pursuit of science. When

it fortunately happens, that the attention is thus directed in early life, the unruly paffions will not gain a premature admission into the youthful bosom. Many a rural nymph might have been saved from heart-felt misery by such a knowledge of botany or mineralogy as would completely have occupied her leisure hours in retirement; while, from the mere want of objects to engage her attention, the Damon or the Corydon that first presents himself, seldom fails to become fatal to the vacant mind.

Where the attention has been early engaged in fiction, it will not, without great difficulty, be turned to realities. The cause is obvious. It is the business of fiction to excite emotion; the mind delights in this excitement; and where it is frequently produced, whatever is destitute of it will appear insipid. If, then, we would have the attention engaged in the service of the intellectual faculties, and the faculties employed in the search of truth, we must

[89]

carefully abstain from introducing emotions unfavourable to our defign. From the direction which is given to the power of ATTENTION, the trains of thought will derive their colouring; and the character will ultimately partake of their complexion.

On the truth of what has been here advanced, every person who reflects on the operations of his own mind, is competent to decide. No one who has been accuftomed to this reflection, can be infensible of the power which the attention has over the mind, in introducing trains of ideas corresponding to the objects upon which it has been engaged. The more philofophical the mind, the closer the chain of affociation by which thefe trains of thought are linked together: but the lively and the ferious, the philosophical and the unthinking, are alike liable to receive impressions from the prefent objects of employment. He to whom this fecret of the human heart was open; He who formed the mind, and intimately intimately knew its various propenfities; forefaw the confequence of permitting the chain of ideas, naturally introduced by the business, the pleasures, and the pursuits of life, to remain unbroken. He forefaw, that by this means the heart must foon be alienated from its Maker. His wisdom provided the remedy. "Remember the "feventh day to keep it holy," was one of the first injunctions given to the human race: and a little reflection will convince us, how admirably this decree was suited to that law of our nature, which I have above endeavoured to explain.

If our present occupation necessarily engages our attention, and our attention introduces trains of ideas allied to its object, it necessarily follows, that, in order to recall the attention to a contemplation of whatever is remote from the general objects of pursuit, a total change of employment is the most effectual means that could possibly be devised. With the rest that by

the Divine appointment took place on the feventh day, the ideas of infinite wisdom, power, and goodness, manifested in the creation of the world, were inevitably affociated. A fense of the Divine presence was thus kept alive in the mind of man; and as long as this falutary institution was duly observed, the trains of thought which it excited, failed not to produce obedience to the Divine commands. To this truth the history of the Old Testament gives ample evidence. We there fee, that at whatever period the observation of the fabbath fell into difuse, the knowledge of the one true God, and obedience to his moral laws, were equally forgotten. Nor where it was observed most punctually, was the observance of any use, when the affociations that were at first connected with it, were changed into a gloomy and illiberal superstition. Such was the case at the time of our Saviour's appearance; but far from being abrogated by him, " who 66 came this inflitution, founded on the nature of the human mind, and coeval with its creation, must continue obligatory till the nature of the human mind is changed. From the period of our Saviour's death, it presents affociations still more interesting to the heart than the ideas of creating power. It is to us a perpetual memorial of an entrance into a state of eternal happiness; a returning session of gratitude and joy!

Addressing myself to professed Christians, I should not have thought it necessary to say so much upon this subject, if I had not observed the erroneous ideas concerning it, which now prevail. What harm is there in doing this? What sin is there in that? is the common answer to every objection against pursuing the pleasures or the business of life on Sunday. From the scope of my argument it will appear, that the harm and the sin arises from perpetuating trains of thought, foreign to all that is

of real importance to our eternal welfare. Such a total change of employment on every feventh day, as will ferve to break these affociations which tie our hearts to the world, and to introduce trains of thought favourable to devotional fentiment, to felf-examination, to humility, and benevolence, cannot be deemed a matter of fmall importance; and most earnestly would I recommend it to parents to accuftom their children from infancy to this indeed, to be fo managed as to produce delight; which it will never do, if Sunday be made a day of wearifome idleness, or of gloomy restraint. Let it be a day of love, of cheerfulness, of familiar intercourse with vour children. Let their little hearts be led to rejoice in Him who made them. Turn their attention to observe his goodness in the works of creation and providence. Make them fenfible of the benignity which decreed a day of rest to those inferior animals, which are so useful to man: and by every means in your power, endeavour to introduce upon the day set apart for the fervice of God those trains of thought, which are connected with the emotions of delight and gratitude.

It has been already observed, how far our affociations are influenced by time and place. By this law of the human mind the advantages attending public worship will be fufficiently explained. Every prayer to God for Divine grace to affift us in conquering the evil dispositions to which we are, alas! too prone, introduces affociations favourable to virtue: and if any particular hour of the day is habitually thus employed, the return of that hour will introduce these affociations to the mind. Hence the advantages of devoting the morning to religious exercifes. train of thoughts introduced by these is the best preservative against temptation.

I leave you to purfue the fubject in your own reflections; and be affured, that it is worthy of far more ferious investigation than has now been bestowed upon it by your friend.

Adieu.

LETTER IV.

CONCEPTION.

Introductory Observations.—Mr. Lockes
Definition of Discernment applicable to
Conception.—The Evils arising from the
Want of clear and accurate Ideas.—How
these are to be obtained.—Conception to be
exercised in early Life, on the Objects of
Perception.—Books.—Peculiarity of Temperament.—The Conceptions of melancholy Persons languid.—Observations.

OU express your apprehension, my dear Friend, that the investigation upon which I have entered, will appear too dry and uninteresting to the generality of female readers. I cannot, I confess, think so meanly of my sex. I cannot think, that any, who have the least pretensions to rationality.

tionality, can be destitute of curiosity refpecting those various powers of the mind which they are conscious of exercising. I cannot think, that fuch of them as are honoured with the character of mothers, can be indifferent upon a subject, their accurate knowledge of which may produce confequences of fuch importance to their offspring. Those, indeed, who are destitute of all feelings towards their children, except those of vanity and ambition; those whose affection is but a fort of extended felf-love; may turn from an analysis of the intellectual and moral powers with difguft. for to them the study would be of no avail. Let fashion be their guide, and prejudice their teacher; but let it not be expected. that the children of fuch should attain excellence. No, not even in those accomplishments, to the acquirement of which the best years of life are exclusively devoted.

The mother, who finds it difficult to enter into subjects that require reflection,

has in the consciousness of the disadvantage under which she labours, a powerful incitement to guard against a similar obstacle to improvement in the minds of her children. Senfible, as she must be, that this inability arises from a neglect of the early cultivation of her own faculties, she will In a book on Education the will not feek for mere amusement; nor will she cast it aside, because it contains principles which stand. She will go over these principles with attention; examine and re-examine them; comparing them all the while with her own confciousness, and her own obcondemn, nor to approve, upon a curfory glance. Those who read from such motives, and with fuch views, will, I hope, find enough in these Letters to engage their attention;

attention; while, fully fentible of the impossibility of blending much of the figures of fancy with such subjects, they will pardon the writer for addressing the judgement rather than the imagination.

You, my dear Friend, and those who. like you have a serious interest in the object of our present investigation, will now go along with me in examining the faculty of Conception; a faculty which attention to the objects of perception naturally unfolds, and which attention alone can bring to maturity.

Conception not only prefents to the mind diffinct notions of the abfent objects of perception, but likewife possesses the power of combining those ideas, so as to give us distinct notions of objects we have never seen.

The ball (or clue) of white cotton that is now before me on the table, to me is an object of perception. You, perhaps, have no fuch object in view; but no fooner do

I mention

I mention it, than you have a conception of its appearance. Neither of us, perhaps, ever faw a ball of gold thread of equal fize; but both of us can conceive of it; and could conceive it, had we never feen fuch a thing as gold thread in our lives. By our perceptions we have obtained an idea of gold; by thefe, likewife, we have learned the nature of dustility and tenacity. We are told, that gold is sufficiently ductile and tenacious to be drawn out into the finest threads; and this we can conceive, although we never faw it done. Of ductility and tenacity we may have a just notion from experience, though we may be unacquainted with the terms by which these properties are expressed; but if we ance with the terms that will lead us to a conception of the possibility of converting a piece of hard and heavy metal into flexible wire or thread.

Hence appears the importance of acquiring habits of accurate perception; fince upon the diffinctness of our perceptions the clearness of our conceptions evidently depends. Attention is equally indispensable to both faculties. From an habitual want of attention in examining the objects of our external fenses, arise erroneous Conceptions; hence false affociations are formed, tending to mislead the judgment and pervert the reason.

That mind which can most justly and accurately reflect the images of its former perceptions, is best prepared for the exercise of all its higher faculties.

What I have here faid of Conception, you will perhaps think is, in fome refpects, equally applicable to memory. You will, however, please to observe, that there is this difference betwixt them—memory is employed upon the past, while conception includes no idea of time whatever. Without memory there could neither be conception.

ception nor judgment. It is, therefore, a faculty which certainly demands the most affiduous cultivation: but as the cultivation of it seems to be almost the sole object of modern education, and as rules for its improvement are to be met with in every treatise on education, I shall only touch upon it incidentally.

Much of what Mr. Locke fays of difcerning is strictly applicable to conception. "It is not enough," fays he, " to have " a confused perception of something in se general; unless the mind has a distinct es perception of objects and their qualities, 66 it would be capable of very little know-" ledge. On this faculty of diffinguishing 66 one thing from another depends the evidence and certainty of feveral even " very general propositions which have " passed for innate truths." Again; "How 46 much the imperfection of accurately dif-" criminating ideas one from another lies e either in the dulness or faults of the organs

"organs of fenfe, or want of acuteness, careful, or attention, in the understanding, or hastiness and precipitancy natural to fome tempers, I will not here examine; it suffices to take notice, that this is one of the operations that the mind may reslect on, and observe in itself. It is of that consequence to its other know- ledge, that so far as this faculty is in it- felf dull, or not rightly made use of, for the distinguishing one thing from another, fo far are our notions confused, and our reason and judgment disturbed or missed."

All the foregoing paffage applies to the conceptions. The faculty may be in itself either dull and languid; or from habitual inattention to the objects of perception, upon which it first begins to operate, it may be inaccurate and confused. In the memory of persons whose conceptions are, from any of the above-mentioned causes, languid and indistinct, every thing seems to be stored in confusion.

[104]

Where there is no accuracy of conception, the power of retention is of very little use. We clearly see instances of people who remember things as if it were by halves, and in their repetition of the observations or of the occurrences that have been related by others, they go on floundering from error to error, and without any intention to deceive, are perpetually guilty of the most flagrant misrepresentation. Hence arise many, if not all, of those petty strifes, jealousies, and resentments, which are most inimical to the happiness of social life.

As without just and accurate conceptions the true meaning of an author can never be discovered; to persons who labour under this confusion of ideas, reading, instead of being a source of improvement, is the very reverse. Unhappy the author, whose writings are subjected to the criticism of readers of this class! From the consusion of their own ideas, they are for

ever mistaking or perverting the meaning of others; and totally unconscious of their own want of discernment, they scruple not to decide and to pronounce with confidence upon what they do not understand.

The mind whose conceptions are in general clear and accurate, will not be forward in pronouncing a decisive opinion, upon a slight and partial investigation of any subject whatever: it is misconception that, in many instances, gives rise to prejudice and to injustice.

As accurate conception is alike neceffary to the acquirement of knowledge, and to the practice of candour and humility, I shall make no apology for dwelling upon the subject at some length; pointing out the causes, from which, as I apprehend, a deficiency in this faculty generally proceeds; and giving such hints as may be useful to its improvement in early life.

This faculty in a particular manner partakes of the difpositions of the mind. It

accords with the tone of the passions; and as these incline to the cheerful or the melancholy, the conceptions will generally be found to be lively or languid. What gives strength to this conclusion is, that upon subjects which correspond to the tone of the affections, the conceptions of the dullest person are sufficiently acute.

A felifif person, whose ideas upon every other subject are languid and confused, will have clear and distinct conceptions of all that relates to felf-interest. I have known those who could not by any means be made to comprehend the simplest proposition upon any subject of science; whose ideas of the affairs, the feelings, and the interests of others were so faint and languid as to be with difficulty recalled; who, nevertheless, had such clear and accurate conceptions upon whatever promised to gratify their own avarice or ambition, that they could, in these points, enter with ease into the most

elaborate disquisition, pursue the most intricate chain of reasoning, or follow the longest series of calculations. It is evident from hence, that the dulness of conceptions upon other subjects was not the defect of Nature, but originated in the predominance of felsishness—an affection, which, wherever it prevails, engrosses the powers of attention.

And here let it be remarked, that in all the felfish and diffocial passions, such as envy, jealously, rancour, & c. the slow of the ideas is dull and languid; and that wherever these passions predominate, the conceptions are never strong and lively. How great, then, is the folly of parents, who, while they wish their children to be possessed of wisdom and knowledge, pay no attention to the birth of those passions, which present the most insuperable bar to the accomplishment of their wishes!

Pride is a passion not particularly attached to any peculiar tone of disposition. It attacks the lively and the ferious, the felfish and benevolent; but its operation upon the powers of conception, in these opposite characters, is effentially different. In strong and vigorous minds, pride sometimes stimulates to the defire of knowledge. In this case it adds strength to the power of conception; attention is then exerted, and exerted with effect. By means of this passion operating on an ardent mind, the task of instruction may doubtless be rendered easy to the tutor. By him, therefore, whose fole object is to give his pupil knowledge, pride must be considered in the light of an useful auxiliary. To those who consider the perfection of the moral character as an object of still greater importance than the attainment of any, or even of all, the intellectual accomplishments, pride will appear in other colours; nor will they wish their children to pluck of the tree of knowledge, like our first parents, at the fuggestion of a fiend!

Where

Where pride unites itself to the timid and low-spirited, no conceptions will be found lively or vigorous, excepting such as correspond with the tone of the accordant passions. While upon such minds the recital of great and noble actions, instances of the most exalted generosity, and of the most disinterested benevolence, make little or no impression;—the conceptions are lively, with regard to the slightest indication of contempt; they are vigorous in the representation of injury or injustice; and wherever pride or self-love are concerned, they are uncommonly vivid.

Where a tendency to envy or malignity pervades the mind, the conception will be languid with regard to all that is fublime or beautiful, either in moral actions or fentiment; whilft with eagle eye it will feize on every blemish. This, as has been already hinted, is the inevitable consequence of the direction given to attention, for in that direction alone will the conceptions be vigorous.

Wifely has it been ordered by Nature, that the power of conception should appear in the mind at fo early a period, as to admit of its being cultivated to fome degree of perfection, before the diffocial passions have any abiding influence in the heart. The more this faculty is exercised upon will these passions have of gaining an ascendancy. The works of Nature and of Art present an inexhaustible source of ideas to those who are taught to examine them with attention; and where the attention is duced into the mind will be of an opposite nature from those which produce turbulent

The manner in which children describe what they have seen or learned, affords the best criterion that I know of, whereby to estimate the strength and vigour of conception. By requiring clear and accurate descriptions, we do much more to invigorate

this faculty, than by all the fet leffons in the world. Children, who have never been exercifed in this way, are at first at a great loss for expression; and it is no small advantage to the mind to be thus set to work for words to express the new ideas it has acquired. A little affistance may at first be not only useful, but necessary. But of affistance in this way the parent ought never to be lavish; as it is one of the greatest drawbacks upon the improvement of the infant faculties, that teachers, to save themselves trouble, tell all, and leave the children to tell nothing.

I have formerly noticed, that the quickness or the flowness of the course of our ideas depends much upon the disposition of the mind to melancholy or cheerfulness. Childhood is naturally cheerful, and the flow of ideas at that period of life is consequently rapid. Nature has wifely ordained that it should be so. The power of reslection, by which we in a manner arrest ideas in their course, is not then brought forth; fo that at this period of life children could not avail themselves of the flower succession of ideas to increase their knowledge.

As the ideas of children are few, and as the course of these ideas is rapid, it follows, that the fame ideas must frequently pass through the mind. Here, likewise, I observe a wife provision made by Nature for the cultivation of the first faculties that appear, and in the cultivation of which the strength of the other faculties ultimately depends. Incapable of long and fixed attention to any object, a repetition of the fame ideas is absolutely necessary to the due operation of these powers. This circumstance I believe to be very little attended to. We judge too much of the minds of children by our own; our ideas, except when under the influence of fome of the exhilarating passions, slow in slow fuccession. The frequent repetition of the fame idea is to us unnatural, and confequently irkfome; hence we rashly conclude that it must be the same with children. We therefore injudiciously press new ideas upon them before the mind is prepared for their reception; and by doing so, we often render inaccurate conception habitual.

Viewing the fubject in this light, I confider the multitude of little books that are now given to children at an early age, as fo many destroyers of their faculties. If the conceptions have not acquired vigour by being exercifed on material objects, before they are employed on those emotions which it is the bufiness of fiction to describe, I greatly apprehend that they will never be cultivated to perfection. The only books, therefore, that are fit for children, are fuch as convey clear, just, and accurate ideas upon fubjects to which the attention at that period ought chiefly to be directed. Nor will the books that are best calculated for aiding the infant mind in the acquirement

of just ideas, be of any use, unless the ideas they give be permitted to make a due impression, which they never can do at a superficial glance.

The balf conceptions which a child at first forms from the best book that can be put into its hands, may prove equally injurious to its mind, as the erroneous ideas conveyed by works that are less judicious. By frequent and repeated perusals it is, and by these alone, that a child can attain a clear and distinct comprehension of the meaning of even the most trisling story; nor will this re-perusal appear to a child, as it would do to us, tiresome and insipid, unless its appetite for novelty has been excited by ton frequent gratification.

Observe with what delight an infant listens to the same tale that has been a hundred times repeated by his nurse, and a hundred times is heard with ever-new delight. In the limited number of the child's ideas, and in the velocity with which they

[115]

pass through the mind, we may see the cause of this unsatiated pleasure received from the repetition of the fame foolish tale. To these oral communications books fucceed; and it would be well it both tales and books were always calculated to affift the opening faculties, to awaken the benevolent affections, to give a proper direction to curiofity, and to inspire an early love of knowledge and virtue. In the " Evenings at Home, or Juvenile Budget," utmost extent; and I am well convinced, that the child, who, from the time of its being able to read for itself with pleasure, till its eighth or ninth year, is restricted to these books alone for its literary amusement, will, at the end of that period, be found possessed of a greater number of clear the inflructive and entertaining stories that were ever written for children of that age.

[116]

In speaking of the books that are read by children, you will please to observe, that I restrict my meaning to those which they perufe of their own accord for their own amusement. The books which they read as leffons, I confider as diffinet from thefe. The child, who never opens a book but as a task, must have been the victim of neglect or mismanagement. Nature so ftrongly impels the young mind to feek the acquirement of new ideas, that if the curiofity she has implanted be entirely quenched, we may be affured that this has not been effected without fome pains on our part. But curiofity, though not eafily effaced, may be eafily directed to low and grovelling objects; and it is not without some pains that it can be turned into those channels, where its activity will be truly useful. I have feen a little girl, whose burning curiofity no drawer that contained a piece of finery could escape, who would risk disgrace and punishment to gratify herfelf by peeping into the trunk or closet, which was prohibited to her approach; and who would yet evince such manifest indifference towards information of every other kind, that it was impossible to rouse in her a wish for instruction. Such is the consequence of the early direction given to curiosity.

The first step to clear and accurate conception is the careful examination of material objects. Without this, the conceptions obtained from description must be languid and confused. Where the perceptive faculty has been sufficiently exercised, the conceptions obtained by the description of absent objects, or of the feelings and sensations of others, will be sufficiently lively, provided the language in which they are conveyed be sufficiently intelligible. So many meanings are, through the poverty of language, attached to the same word, as to be the means of occasioning much confusion in the ideas of those of riper years: and I believe it often happens, that where

a false affociation has been attached in infancy to a word not in common use, it remains indelible to the latest period of life. I was told by a Gentleman of no common endowments, that in reading to his mother when a child fomething concerning the Patriarchs, he blundered on the word partridges. His mother fet him right, but without any explanation of the meaning of the term patriarch: fo that when it next occurred, instead of venturing to pronounce it, he called out, " here, mamma, " are thefe queer fowl again!" Again she taught him to prouounce the word, but without destroying the affociation that had been formed, by clear explanation; fo that it continued fo far to operate, as that whenever he afterwards heard the word

Most words that are not in such common use as to be familiar at an early period, are capable of definition: and much pains

ought to be beflowed in defining them as they occur, if we would have the conceptions clear and accurate. What is faid upon this fubject in "Practical Education," I would recommend to your ferious attention.

Before I conclude the prefent letter, I must beg leave to recall your attention to one of the instances I have given of the partial and limited power of Conception, in a person of languid spirits and much sensibility. This melancholy temperament is sometimes hereditary, sometimes occasioned by disease, and sometimes also is born of mismanagement in early life. From whatever cause it originates, it is a missortune of such magnitude, as calls for our utmost exertion to prevent its progress, and, if possible, to effect its cure.

Mothers, I apprehend, are feldom aware of the important confequences which refult from their conduct to beings of this description. There is something so amiable and en-

dearing

dearing in the gentlenefs which commonly attends this langour of fpirits, that it naturally infpires tendernefs. This tendernefs is encreafed by that helpleffnefs which clings to the maternal bofom for fupport. But if this tendernefs be not enlightened and guided by reafon, it will prepare a neverending fund of mifery for its unhappy object.

The inevitable effect of indulgence in generating felfishness, I have explained at large in the former volume: and as felfishness is the never-failing concomitant of the disposition above described, it follows, that it is the particular duty of the parent to guard against nurturing and increasing this natural tendency.

From the languid flow of ideas in the low-fpirited proceeds an indolence of mind, which terminates in torpid apathy. Sel-fishness is then the sole spring of action: benevolence may dwell upon the tongue; but no seelings, no affections, but such as are connected with felf-love, ever touch

the heart. Such an one finds friendship necessary to his support, to his comfort, nay to his very existence. He therefore clings to his friends with fondness; but what confolation, what comfort, what fupport, does he afford them in return? Does he enter with the same interest into the feelings of others, with which he expects others to enter into his? No. But this a want of benevolence or of attachment. It proceeds from a want of conception concern felf. How would many of our those who are yet at a period of life, when

In the education of children who indicate a tendency to this disposition, whether such tendency be hereditary or acquired, par-

[122]

ticular pains should be taken to lead the mind to attend to the teelings of others. Whatever fervices, whatever attentions they exact from others, they should be obliged in their turn to pay. If they are once permitted to imagine, that from the they have any right of exemption from the rule of " doing to others as they " would have others do by them," they are inevitably ruined. It is effential in the flow of ideas. Lively and exhilarating images ought inceffantly to be presented to the mind, and instead of encouraging that disposition to study, which frequently appears prematurely in fuch perfons, the vigorous exertion. Whatever knowledge it acquires, it ought to be made freely to ing will be, to fuch a mind, only another mode of indulging indolence. To conquer

the indolence that invariably adheres to fuch dispositions, every effort ought to be made. These efforts ought to be unceasing; and their efficacy will be much increased by frequently changing the attention from object to object. The variety and beauty of the material world will here be powerfully affistant to the tutor's views. While the perceptive faculties are thus exercised, the mind cannot fink into apathy, or indulge in the luxury of indolent reverie. It will by these means, likewise, acquire that command of attention which is in all cases so eminently useful.

The person who has been so happy as to have attained the power of submitting the attention to the control of will, is in possession of an infallible remedy against many of the cares, and all the minor miseries, of life. He who can turn his attention to the griefs or the joys of others, will never become the prey of selfish sorrow. Even in the langour of sickness, and under the pressure.

pressure of severe pain, we have known people, who were capable of directing their attentions to subjects remote from self. This power over the attention is particularly difficult of attainment to the naturally timid and low-spirited. It is, however, to them peculiarly necessary: and no pains ought to be spared to put them in possessions.

The devour affections, besides being of the utmost moment to such characters, as offering them a source of continual support and consolation, will, if cheerful ideas be affociated with them, prove effentially instrumental to fortitude. Before the devour and the benevolent affections the disposition to selfishness vanishes, as the clouds of morning before the radiant sun. Let the susceptibility of the mind be cultivated under these auspicious beams. Be it endeavoured to render its conceptions of the sublime and beautiful so clear and distinct, as to render the mind alive to the emotions

of fublimity and beauty, as often as opportunities of calling them forth recur: and by these means, you will cultivate taste, invigorate the intellect, give new animation to the spirits, and render a character, which would, by injudicious management and soothing indulgence, have sunk into insignificence, happy in itself, and useful to society.

Another and a powerful motive to the diligent improvement of the faculty now under confideration, will be found in the affiftance to be derived from it in inculcating a firm adherence to truth. Falshood is the vice of weak and timid minds. To those whose conceptions are languid and confused, it is impossible that misrepresentation can ever appear in a very atrocious light. In these misrepresentations they are utterly unconscious how far they depart from the truth, because of the truth they have no distinct idea: and it is impossible, in consequence, to convince them of the turpitude

turpitude of falfifying. By obtaining clear conceptions, and by being accultomed to give an accurate account of the conceptions it acquires, the mind becomes habituated to truth; at the fame time that the diffance betwixt truth and falfhood becomes in such minds actually enlarged, and the difficulty of departing from one to the other is confequently increased.

The confused and inaccurate conceptions of the vulgar, arising from a total negled of this faculty in their early education, renders them for ever liable to the vice of lying. Cunning takes its rife from the fame source: and though many a departure from truth may be laid to the charge of vanity, I believe we shall generally find, that where the conceptions are clear, diftinct, and vigorous, the character will be upright and fincere.

Adieu.

LETTER V.

CONCEPTION.

Possessed in different Degrees of Vigour.—
How it may best be cultivated in those of slow Capacity.—Exemplified in a Variety of Instances.—Difference betwirt a Memory of Perception, and the Recollection of Ideas.—The Advantage of cultivating the latter.—Illustrations.

THE greatest difference that exists with respect to intellect betwixt individuals, whose organs of perception are equally perfect, will be found to consist in the vigour or the weakness of the faculty of Conception. That this faculty is imparted by nature in very different proportions to the human race, will probably be acknowledged by all who argue less from theory than experience. Like all the

other intellectual faculties, it is, however, capable of fo much improvement, that where it is possessed but in a very moderate degree, it may, by careful cultivation, be so strengthened and improved, as to conquer the desiciency; while by contrary management, the conceptions which were naturally lively and vigorous, may, for want of use, become faint and languid.

To point out the most likely method of fucceeding in the cultivation of this facult, where it appears in a weak and imperfect state, shall be the subject of this letter; and as the hints I shall offer, are all the fruits of real observation, I feel some degree of considence in proposing them.

The fource of many errors upon this point is the vanity and partiality of parents, which will not permit them to fee, or to acknowledge, even to themselves, that their children can possibly be desicient in any faculty. Willing to be deceived, they permit prattling vivacity to impose

upon them as proofs of quickness of apprehension; and ape-like imitation to pass upon them for acute judgment.

When these lively prattlers advance in years, people are surprised that what they looked upon as the promise of genius, should end in dulness and stupidity. Instead of this blind and ever misjudging partiality, would it not be better for parents accurately to examine and to appreciate the faculties of their children; that so, by an attentive cultivation, the barren soil, whose gaudy weeds pleased the eye and amused the fancy, might be rendered really productive, and enabled to bring its fruits to maturity?

Children of flow capacity require for much attention, fuch unwearied patience, fuch unremitting affiduity, that maternal affection is alone equal to the task. The particular attention which they require, it were folly to expect from any less interested than a mother. But richly must

the mother be compensated, who, by her judicious labours, refcues the child of her affections from the degrading state of ignorance and imbecility. When she reslects, that instead of the rational companion, the fleady friend, the prudent advifer, whom fhe now finds in her child; the fame child would, by a conduct less judicious on her part, have been doomed to grope through life in a state of helpless ignorance; envi-

The mother, who, by attending to the early education of her children, gives herfelf a real title to the maternal character. has, in the cultivation of their faculties, a great and manifest advantage over every

She is intimately acquainted with the progress, nay with the very number of their ideas, and thus possesses the master-key of their minds. Shame on her who carelessly

throws it aside, and indolently permits the only gate that opens to improvement, to be shut for ever!

Though the perceptions may appear quick where the apprehention is flow, yet I am inclined to believe, that in this cafe they will, upon examination, be found to be neither diffinct nor accurate. Great pains ought, therefore, to be taken with children of flow capacity, to invigorate their perceptions. Without great pains, they will not receive the fame number of ideas from external objects, with children of more lively parts: and as thefe ideas are the foundation of all intellectual improvement, it follows of courfe, that where they are imperfect, or few in number, the difadvantage can never be remedied. To call objects, and to aid the mind in forming of infinitely more importance in the case under confideration, than is generally imagined. The parent who is much with her child, has this branch of education always in her power. Materials for it are ever at hand. The world of Nature, and the works of Art, are equally subservient to her purpose. Let us give an instance.

Mother. "My dear, you are looking at the carpet, I fee. Well, now, try if you can tell me of what it is made."

Child. 'I don't know, mamma.'

Mother. "Examine it better. Feel it. Is it hard, like the floor."

Child. 'No. It is fost, and it is pretier than the floor.'

Mother. "Its colours have nothing to do with the question; the carpet would be as good a carpet, though not so pretty a one, if it had never been dyed at all. Look at it again, and try if you can find out what it is made of."

Child. 'I now fee threads in it. I believe it is made of big threads!'

Mother. "You are partly right; but are these threads made of the same mate-

rials as the thread with which I am now fewing? Come, and look at it."

Child. 'No, I fee there is a difference; and the threads that make the carpet, are red, blue, and green.'

Mother. "The colours are of no confequence, let us not think of them at all. Let us examine a thread of the carpet, without minding the colour; and fee, here is one; compare it with mine, and tell me where you perceive a difference."

Child. 'It is bigger and fofter.'

Mother. "The foftness may lead you to guess, of what it is made."

Child. 'I believe it is made of wool.'

Mother. "And what is wool? Where,
or how, does it grow?"

Child. 'I cannot tell.

Mother. "Wool grows upon the backs of fheep. It is clipped off every year with large feiffars; and after being washed and carded, is spun into yarn, which you call threads."

Child. 'Well, mamma, tell me more,' Mother. "It is then fent to the dyer, who dies one part yellow, another green, and fo on. It then goes to the weaver, and he weaves it by a pattern, as you fee. And now you understand that the colour is mere matter of choice or fancy; but that it is not absolutely necessary, like the wool, or the spinning, or the weaving."

Child. 'Yes. I understand all this very well.'

Mother. "Do you think you will be able to tell me this over again to-morrow."

Child. 'Yes. I could tell it all now.'
Mother. "No, not now, but I should like to hear it again to-morrow; and then we shall go and look at the sheep, and their pretty lambs; and you shall learn all about them."

All this may poffibly appear highly nonfenical to those who think it is by books and tasks that every thing is to be learned. We may, however, venture to affert, that all the above conversation might be read as a lesson by a child of slow capacity, without its having the smallest conception of its meaning, or acquiring a single idea upon the subject; while given as I have described it, distinct and accurate notions are acquired by means of the perceptive faculties. It is by these, and these alone, that the conceptions of dull children are to be invigorated; and this not without much pains and trouble on the part of the preceptor.

The difficulty which a flupid child finds in attending to the letters, the words, the flops, and the fentences, renders it altogether impossible that it should derive any new ideas from this fource. While this difficulty subsists, all the little attention which it can command, will be absorbed in attempts at reading with propriety. The exertion of this attention is so disgusting to a torpid mind, as to create weariness and aversion. Nor can we wonder at this,

when we confider that the perception of every letter is a diffinct operation of the mind; that its found is another, and must be affociated with the figure of the letter; and that words are clusters of these associations, as fentences are of words. Where the power of conception is weak, the power of affociation must be proportionally defective; is it not, then, unreasonable to expect the operation of this faculty, before we have been at any pains to fecure the we, by dint of perfeverance, of allurement, a reader before the faculty of conception gain by it? We may, indeed, gain the plea-

While the learning to read is thus operofe, I should think it better not to attempt

it; nor deem it any lofs, if the child fhould remain ignorant of its letters even for two or three years beyond the period, when children of a more ready apprehension may be taught to read with fluency and precision.

If, indeed, in the interim, it learns nothing; if the mother indolently acquiefces in the flow growth of its faculties, and instead of being actively assistant in their of words without meaning, the child will period of books and tasks. But if, instead of forcing the backward plant, she pains will be amply repaid. By a careful cultivation of the perceptions, by roufing mind will be gradually expanded for the ciples of mechanics, will be found excellent affiftants in opening the mind; and you may take it for granted, that a child of flow parts will be much more advantage-oufly employed in learning the nature and properties of the objects around from the lips of a fenfible and affectionate parent, than in ineffectual attempts at learning the figns of words.

Children are all, in some degree, imitative animals; but as the intellectual powers develope, as the number of ideas increases, as the attention is awakened to an examination of the works of Art and Nature, and as judgment begins to be called into action, the principle of imitation is diminished, or appears to be so, as it comes under the direction of judgment. The child of slow parts, to the improvement of whose faculties no proper attention has been paid, will remain a merely imitative creature during life. By imitation it will learn the use of words, and, if it is much in company with grown-up people, of words that are not usually

found in the vocabulary of children. One cannot but fmile to observe, how easily parents are deceived by this quality of imitation in their children. While the fententious observations of the little prater strike an intelligent observer with pity and difgust, they listen to the infant oracle with complacency and delight! Affectation is the never-failing confequence of this; affectation, which not all the graces and accomplishments can render tolerable, is thus united with folly and ignorance! The poor child remains unconfcious of this union; it is destitute of conceptions whereby it can apprehend the incongruity; and where the conceptions are very dull, the

It is by a lively fense of the impressions which our words and actions make upon others, that our manners are chiefly formed. Those who have not a lively perception of what those feelings are, must be for ever erring against propriety. How many admirable

mirable sketches upon this subject have we from the inimitable pen of Shakespeare! Hotspur's description of this species of impropriety in a self-conceited coxcomb has never been equalled, and can never be excelled. The passage is too long for infertion; and is besides so well known, that it will be immediately recollected by the greater number of readers.

Another striking instance of the same want of conception, with regard to the impression made upon others, is given in the following passage, which, as an elucidation of my remarks, I shall beg leave to transcribe. The scene is in the "Merry Wives of Windsor," when Anne Page enters to inform Slender that dinner waited for him; to which he replies:—

Shn. No, I thank, forfooth, heartily; I am very well.

Anne. The dinner attends you, fir.

Slen. I am not hungry, I thank you, forfooth, Go, firrah, [to Simple] for all you are my man, go wait upon my coufin Shallow: a juffice of

peace may fometimes be beholden to his friend for a man. I keep but three men and a boy yet, till my mother be dead; but what though, yet I live like a poor gentleman born.

Anne. I may not go in without your worship; they will not sit, till you come.

Slen. I'faith, I'll eat nothing; I thank you as much as though I did.

Anne. I pray you, fir, walk in.

Slen. I had rather walk here, I thank you: I bruifed my fhin t'other day with playing at fword and dagger with a master of fence, three veneys for a dish of stew'd prunes; and, by my troth, I cannot abide the smell of hot meat since. Why do your dogs bark so? be there bears i' th' town?

Anne. I think there are, fir; I heard them talk'd of,

Sien. I love the sport well, but I shall as soon quarrel at it as any man in England. You are afraid, if you see the bear loose, are you not?

Anne. Aye, indeed, fir.

Sien. That's meat and drink to me, now! I have feen Sackerfon loofe twenty times, and have taken him by the chain; but I warrant you the women have fo cried and fhrieked at it, that it paft; but women, indeed, cannot abide them, they are very ill-favoured rough things.

Do we not fee in this lubberly blockhead all the marks of a weak and spoiled child, who had been encouraged by the own importance? Destitute of all conception with regard to the impressions that convey an idea of his confequence, of his wealth, his courage, and his delicacy, all tend to make him truly ridiculous. more ridiculous, however, than we have feen many a foolish Miss, in endeavouring to give an opinion of her fenfibility by the expression of filly fears; of her delicacy, by bombastical sentiment; or of her wisdom,

Perfons whose conceptions are naturally dull and weak, must inevitably be exposed to all this ridiculous deportment, if great pains be not taken to prevent the species of self-imposition that gives rise to it. It is, therefore, highly incumbent upon those who have the guardianship of children of slow capacity, to use every means of awakening their attention to the feelings, rather than to the manners, of others. To discourage gross and palpable imitation, to inspire modelly, and to promote that simplicity of manners which is its inseparable companion.

We may endeavour to do this by leffons; but the attempt will be vain, the labour fruitlefs. We may lefture upon propriety for ever; but where the conceptions are fo dull as to impart no intuitive feeling of the conceptions of others, affectation and formality will be the refult of all our pains. The behaviour of children who have been thus leftured into good-breeding, is always ftiff and formal; and the difficulty of changing habits that are thus formed is fo great, that the ridicule of companions is, perhaps, the only means by which a change can be ever afterwards effected.

It is not by lectures, therefore, that the manners of fuch children as we now speak be formed. Children that are quick of apprehension will imperceptibly form their own; but those of a contrary character ought to be made fensible of every improthis is done from a very early age, habits of propriety will be early formed: fo in regulating their conduct according to

A young person will naturally seek the fociety of those whose conversation it has faculties to comprehend. The tattle of the vulgar and the illiterate come within this

description, the vulgar and illiterate will therefore be the chosen companions of the hours of relaxation. Hence low cunning, difguise, hypocrify, and all the little meannesses which render a character detestable and odious. And all this may be the result of that blind partiality and self-indulging indolence, which either will not see the desciency of a child in intellectual endowments, or seeing will not take the trouble to remedy!

By timely attention in very early life, every thing fhort of idiocy may be improved. Gentlenes, patience, and affiduity, are indeed all effential to the due performance of the important task; but by gentlenes, patience, and affiduity, I have seen wonders performed upon minds which were apparently in a state of the most hopeless imbecillity.

It is absolutely necessary in this case for the tutor to subdue all quickness of temper, all irritability of feeling; for by these VOL. 11. the stupidity of the pupil will inevitably be increased. It is easy to conceive what a wretched tutor such a character as Rousseau must have made to a lad of slow parts; we accordingly sind, by his own accounts, that he left his pupils more stupid than he found them.

It at first view appears extraordinary, that where the power of conception is very dull, the memory should, with respect to some things, be tenacious; while with respect to others, it is altogether deficient. A very flow child will often be found to get lessons by heart as soon as, nay some times sooner, than one who is ten times as intelligent. But let such time clapse, as that the words of the lesson are forgotten by both, and then examine them upon its substance; you will then find, that the child of slow conception has not one idea remaining upon the subject; all is obliterated, as completely as if the lesson had never been heard of. The child of quick capa-

city, on the contrary, though it has likewife forgotten the exact words, remembers fomething of the meaning which they conveyed. Does not this clearly prove, that the memory of the first was entirely confined to its perceptions; while the second, who had exercised upon the subject of its lesson some degree of conception and judgment, could recal the ideas conveyed by those, when the particular sounds of the words had escaped the memory.

From the foregoing and fimilar obfervations, it appears to me, that memory may be divided into two diffinct branches, as it is employed on the objects of perception, or on the conceptions. It is with diffidence that I rifk an obfervation, in which I am not (as far as I know) supported by any philosophical writer; I would, therefore, have what I fay upon the subject considered merely in the light of a suggestion worthy of examination by the instructors of youth.

Mr. Locke fays of memory as follows: 66 Memory, in an intellectual creature, is " necessary in the next degree to Percep-" tion. It is of fo great moment, that where " it is wanting all the rest of our faculties " are in a great measure useless; and we " in our thoughts, reafonings, and know-" ledge, could not proceed beyond prefent objects, were it not for the affiftance of our memories, wherein there may be true " defects. First, that it loses the idea quite; " and fo far it produces perfect ignorance, 66 Secondly, that it moves flowly, and re-" trieves not the ideas that it has, and are " laid up in store, quick enough to serve " the mind upon occasions. This, if it be " in a great degree, is stupidity; and he 66 who, through this default in his memory, " there, ready at hand when need and occafion calls for them, were almost as good be without them quite, fince they ferve " him to very little purpose. The dull man, ec who

"who lofes the opportunity whilft he is feeking in his mind for those ideas that fhould serve his turn, is not much more happy in his knowledge than one that is perfectly ignorant."

Again. "This faculty of laying up and "retaining the ideas that are brought into "the mind, feveral other animals feem to "have to a great degree as well as man. "For, to pass by other instances, birds "learning of tunes, and the endeavours "one may observe in them to hit the notes "right, put it past doubt with me, they have perception, and retain ideas in their memories, and use them for patterns. "For it seems to me impossible, that they fhould endeavour to conform their voices to notes, (as 'tis plain they do) if they had no ideas,"

It appears to me, that the former of the above quoted paffages, viz. the account of the peculiar defects of memory, applies exclusively to the memory of our former

conceptions,

conceptions, and that the want of the power of recalling them is, in all these instances, owing, not to the weakness of memory, properly speaking, but to the weakness of the faculty of conception. The languid and confused ideas that are received upon any subject by a weak mind, must be easily obliterated. They are, like our morning dreams, vivid for a moment, but which sade imperceptibly away, "on releave a wreck behind."

What this illustrious author has observed of the memory of animals in the last quoted passage, is, I think, entirely applicable to that memory of our perceptions, betwixt which and the memory of our conceptions there is, as I apprehend, a specific difference. Ideots and brutes remember the impressions made upon their senses, as well as the person of enlightened intellect. (D)* With these impressions the ideas of time and place are powerfully afsociated. The horse never fails to re-

^{*} See Note at the end of the volume.

member the fpot, where he beheld the object which startled him: nor does the little turnspit-dog forget the hour which calls him to duty: yet neither the dog nor horse have clear conceptions of the objects which they thus appear so perfectly to recoilect.

With all the attention paid to the cultivation of memory in modern education, I am afraid that, upon strict examination, we should sometimes find, that it is the memory of perception alone which our endeavours tend to improve. Useful, without doubt, this branch of memory is; and as it comes to maturity with the first of the faculties which the human mind difplays, it may be effectually employed, before the conceptions are fufficiently vigorous to give exercise to the other. But let us not expect more from the memory of perception than it is calculated to produce. Let us not continue to bestow our fole attention upon its cultivation, after the period

that the higher branch of memory has power to operate. As it may be of importance to point out the consequences of this error, I shall beg your attention to the following remarks.

That words are a medium by which ideas or conceptions are communicated to the mind, must be admitted on all hands. Every word is certainly either fignificant of some idea in itself, as are nouns and adjectives; or serves to connect ideas, as we see done by prepositions and participles. But we all know the found of a word to be one thing, and its meaning to be another. With very little trouble, a person of clear perceptions may learn the Greek alphabet, and acquire the proper pronunciation of Greek words; but if he knows not the ideas of which these words are the signs, I cannot see that he is one whit the wifer.

I may read one of Sir Isaac Newton's profoundest problems as well and as diftincily as the mathematical professor

either University; but while destitute of all corresponding ideas, while without a link whereon to fasten the chain of reasoning, I can neither form, nor retain, an idea upon the subject. Do I strive to recollect the fubject, I find nothing but a confused heap of ideas, which are the faint images of the appropriate meaning of the words, as I have heretofore been accustomed to apply them; but nothing wherewith to affociate them, fo as to make fenfe upon the fubject. I may, nevertheless, commit the problem to memory, for memory will retain the ideas of perception; and I may either do this by means of attentively looking at the words, or by repeating them aloud, till the perception is fufficiently strong to become an object of memory. In either case, I shall be equally affisted in my task by the arrangement of the words; as the way in which the words fland with regard to each other, affociates the idea of each word with that which follows it, whe-

UNRAIA SERFOR

ther this affociation be made by means of the eye or the ear. Well, after all this trouble, how much do I know of Newton's problem? Have I one more idea upon the subject of mathematics, than I had before I began to learn it? Surely, no. Go, then, and ask your little boys and girls, when they come from school, what ideas they have upon geography, history, arithmetic, &c.; for exactly in the same way as I have here described, are these sciences taught to children, while their powers of conception are not yet sufficiently opened to receive ideas upon subjects far less abstruce.*

^{*} The following Anecdote I had from a Gentlenian of blunt manners, but great goodness of heart, though being himfelf a bachelor, he could not, perhaps, enter into the maternal feelings, as many of my readers will do. Being once on a vifit to a fond mother, he found her entirely occupied by the extraordinary attainments of her little girl, whom she represented as a prodigy of genius. "Be so good, now, my dear sir, as to ask her any question in geography, or any question that you please, and, you will find how well she will answer in

Let us now proceed with my illustration, and suppose, that after having got the problem by heart, such a length of time should have elapsed, as effaced all remembrance of the words and their relative position. Once lost, the memory of them must be lost for ever. For there is this difference betwixt the forgetfulness of a thing that has once been distinctly conceived, and the forgetfulness of what we have merely learned by eye or ear, that though the former may not be ready at our call, it is nevertheless in the mind, (though in a dormant state) and will be found to be so on accurate research; while the latter is not

Come, love, this good gentleman is going to alk you a queftion." The child advanced, and the gentleman not willing to embarrafs her by any thing difficult, and wishing to get quit of his new office of talk-mafter as foon as poffible, after a little hefitation afked her, "Where was Turkey?" 'Out in the back yard with the young poults,' replied the child with great simplicity. "The very best answer," returns the gentleman embracing her, "that any child of five years old in the world could give to the question."

only faded, but totally obliterated. Hence it would never be in my power, to the end of my days, to recall the problem I had fo learned. But let us suppose, (and I fincerely wish the supposition could be realized) that I had regularly learned the problem, having all along the most accurate and clear conceptions of the whole. The new ideas which I should in that case have received from the problem in queftion, would then have been but an addition to the foregoing chain, and would have added no less to its folidity than extension. The terms in which these ideas were communicated, might fade from my remembrance; but the ideas themselves would remain engraven on the tablet of memory for ever.

Ideas which the mind has thus received, arrange themselves in order (figuratively speaking) with ideas of the same class: with

these they become affociated, and it is by means of this affociation that they are recalled at pleasure. Frequently, indeed, may they be recalled, when the source from which they were derived is lost to our remembrance.

People who are not aware of these laws of arrangement and association, are frequently disheartened, on sinding how little of that which they have even read with the utmost attention, is accurately retained by the memory. But let not such people be discouraged: since they may certainly be assured, that if their conceptions of the subject have been clear and distinct, and that they have given them that degree of attention which is essential to memory, the ideas they have received, will never be totally lost. They will be mingled with other ideas; and with them be recalled, as occasion offers.

While the faculty of conception remains uncultivated, the memory even of the objects objects of perception must be in many inflances defective.

The obvious affiltance which the memory receives from the affociations of ideas, has induced fome philosophers to explain the phenomena of memory entirely upon that principle.* Be that as it may, we are all sensible of its present operation; and we must likewise be sensible, that the greater the number of our ideas, the more materials will the laws of affociation have to operate upon in our minds. These ideas are like so many pegs,† on which to hang the new ideas we receive. Where the pegs are weak, or sew in number, little will be hung up, all will fall down into the

^{*} See Hartley.

[†] As Plato had his cave in the mind, and Mr. Locke his dark room, I don't fee why I may not drive up a few pegs in it. Placed by my feeble hand, they can do no injury. Whereas, had an ancient philosopher made use of such a figure, the world might have gone by the ears, about their length and dimensions.—See Berkeley and Hume worn Ideas.

abys of forgetfulnes. Now those whose memory is chiefly employed on objects of perception, are exactly in this predicament; there are no pegs in the minds of such, whereon to hang their new ideas, but two, viz. time and place: these are the only affociations which affift the memory of the vulgar. Events which produce in enlightened minds a series of useful reslections, serve with them no other purpose but to recall some former period, when something similar occurred.

"Yes," fays the fleward, "I remember when I "was at my Lady Shrewfbury's,

"Such a thing as this happened, just about the time
"of gooseberries."

Shakespeare gives many admirable inflances of this species of affociation in vulgar characters, and to these I refer the reader.

If the remarks which I have ventured to make, are admitted to be founded in truth, it evidently follows, that the cultivation of that branch of memory which belongs to perception, will have no influence in expanding the powers of the mind. That it is only by cultivating and improving the faculty of conception that this can be accomplified: and that while this is unattended to, the whole Encyclopædia may be got by heart, without giving any more ideas to the pupil, than if he had been all the time employed in repeating the letters of the alphabet.

Is, then, the cultivation of the memory of perception, a matter of no importance! Ought memory never to be exercised, but upon subjects which children can fully comprehend? To these queries I shall take a future opportunity of giving a fatisfactory answer: and shall leave you for the present to reslect upon what has been already advanced. Adieu.

LETTER VI.

CONCEPTION

Lively Tempers particularly liable to Inaccuracy —How this Fault is to be obviated. —The proper Exercise of Memory in early Life considered.—Illustrations.

B FFORE I proceed to make any further observations upon the subject of memory, I shall take notice of the third cause assigned to Mr. Locke for that imperfect discernment, (or conception) which renders the mind incapable of discriminating ideas one from another; namely, the hastiness and precipitancy natural to some tempers.

VOL. II.

I have formerly had occasion to observe, that the rapid course of ideas in the minds of the lively and vivacious is inimical to attention; and that without attention there can be no accurate perception, no memory, and consequently no discernment. It is, therefore, to dispositions of this cast, of the utmost importance, to acquire the habit of commanding attention in early life. In proportion to the vivacity of the disposition will be the difficulty of acquiring this habit; and in proportion to the difficulty it the necessity of making the attainment.

This fubject will rife into important, when we confider, that it is entirely owing to a want of proper attention to it during the early part of life, that genius is fo often rendered not only an ufelefs, but a baneful gift. Minds which eagerly catch at new ideas, without accuracy, without difcrimination, will be for ever liable to mifconception: they will be ardent in error; and, alike precipitate in conduct as in judgment,

they will act, as they affert, with raftness and presumption. They may acquire knowledge, but wisdom will not be the result of the acquirement. They may be brilliant, but they will never be useful.

of the capacity, we render it incapable

distances and proportions. While the former power remained defective, it would be of little consequence that the latter was, by the use of stimulants, so far increased, as to enable the eye to see at once a still greater number of indistinct and imperfect images. To give perfection to the sense of sight, we must be able to perceive objects clearly and distinctly, as well as quickly. And just so it is with the mind; which, if destitute of the capability of discrimination, will reap no advantage from the number of imperfect ideas with which it is stored.

Inftead of flimulating these quick and forward dispositions to the acquirement of new ideas, we ought to bestow the utmost pains in checking the rapidity of their thoughts; and in discouraging the hastiness of their conclusions. While the slow ought to be led with gentleness, these ought to be made keenly sensible of every error; especially when these errors have their source in the rashness of considence,

and the prefumption of felf-conceit. They ought to be made to fee and to feel the advantages of attention, and every opportunity should be feized for bringing the difadvantages arifing from a want of attention home to their feelings. A feemingly quick apprehension of what they learn, ought never to be accepted. They must be made to view every subject in every light of which it is capable, and to examine it in all its parts, so as to acquire not only lively, but distinct and true notions concerning it.

Habits of accuracy and arrangement are of fuch importance to these volatile spirits, that they ought to be carried into every part of their business; and on no pretext to be dispensed with. Their employments, their amusements, their hours of meals, of dressing, and of relaxation, in short, the whole of their time, ought to be under the strict invariable rule of discipline. There is an eccentricity attending

tending these characters, which, without constant attention, will be perpetually flying off into some extravagance: and if this be much indulged, we may bid a long added to all improvement.

rule with regard to the employment of

be for ever interrupting the course of her instructions, need not expect that much benefit from them will ever result to her children. It is of little consequence how these chasms are filled up: by the indolent they will probably be spent in sauntering idleness, and in frolicksome mischief by the vivacious; but they will prove alike injurious to both.

The cultivation of every faculty is attended with a confiderable degree of effort; and effort does not cease to be painful until it is relieved by habit. Where the effort is subject to irregular interruptions, it will continue to be for ever painful, and will consequently be avoided as much as possible. It ought to be the peculiar care of the preceptor to render these efforts easy by confirming them into habits; which cannot be done but by perseverance.

Every difficulty will be fmoothed by the habit of attention; but the habit of attention must be the effect of many painful efforts in the quick and lively, as well as in the flow and dull. Very different. effort of attention. In the languid, we mu awaken the dormant spirit of curiosity; we exhilarating. When the mind is in this

To fix the attention of the volatile and precipitate, a very different course must be pursued. We must begin at a very early period to demand accuracy in the examination of objects. We must bring the spirits under the subjection of authority.

Instead of seeking, as in the other case, variety of cheerful images to the mind; we must use our utmost endeavour to allay their effervescence, without injuring the

The faculty of conception in these two opposite characters, and the different methods to be observed in improving it, may be compared to the process of crystallization in some chemical experiments. In these

it fometimes happens, that in one inftance the folution must be stirred and agitated before a single crystal will appear; while in mixtures of an opposite nature, the fermentation must be made to subside, and all must be rendered calm and still, or the particles will never coalesce.

To children of keen and lively perceptions, it is of the greatest consequence that the occeptor should be quick and penetration and to all who are engaged in the interior of youth, it is absolutely effectial, that they should be able instantly to discern the occupred and accuracy of the conception to the time the mind of the child, on what they are the percentaged.

There end partiality are infuperable to this difference. These will always accept of a "yes," or "I understand it," from the pupil, as sufficient conception; but a less partial or more difference a less partial or more difference, the countenance will betray the or the vacancy of the mind within.

A good Lady I once knew, who devoted much of her time to the inflruction of the ignorant. It happened, that I was by one morning when one of her little protegées was reading to her in the Bible. The fubject was the taking of Jericho. At every time that Joshua marched round the walls, a pause was made, and a lecture given by the good lady on the wonderworking power of Providence; of which I evidently saw her little auditor understood not one word. At length the trumpers founded, and "now, Betty, now you will see how the walls of this wicked place will fall at the prophet's voice!"

I here begged leave to fpeak, "Pray, "Betty, what was Jericho? was it a man, " or a woman, or a place, or what?"

'I believe it was a woman, Ma'am, returned Betty, with great fang-freid.

I make no doubt that inflances may at this moment occur to your recollection, when, upon fuch mal-apropos examinations, answers would have been returned, as line fatisfactory to the preceptres as that I have above related. Nay, it is more than probable, that if you have ever chanced to be present when a book beyond a common novel has been read aloud

to a company of ladies; or above all, if you have ever attended a philosophical lecture; you may possibly have had occasion to mark the formation of conceptions to less erroncous and incongruous.

the most effential difference may ever the content of the content

will admit of cure. In early life, therefore, its cure ought to be affiduoufly endeavoured; and few more effectual remedies will be found than frequent mortification. This mortification is fo fevere a

punishment to an ardent mind, that to avoid it, it will willingly submit to the painful effort of attention. Mortification must, however, be administered with a cautious and judicious hand; else it will harden the mind, instead of humbling it. It must be made to refult from a sense of its own precipitancy, and led to perceive, of its own accord, where that precipitancy plunged it into error; and by tracing back its steps, it will lose much of that self-considence, which is the great bane of youth in modern times.

That much of the felf-fufficiency and arrogance, which is so often, and alas! so justly, complained of by the observing moralists of our age, may be traced to the source of a superficial education, I, for my share, have no doubt. By learning a line of many things, without acquiring just and accurate ideas upon any, they in fast learn nothing but conceit and prefumption. Having never been made to feel the necessity of acquiring clear and distinct conceptions

upon whatever fubject engaged their attention, they are unconfcious of their deficito, They conceive not the confusion that reigns in their minds; but confcious of a ving some ideas upon subjects with the those they esteem the vulgar and the morant are altogether unacquainted, pique themselves upon this fancied to civity, and imagine, poor things! that things; when, in fact, they nothing.

then a mind of quickness and vivacity the teen thus accustomed to the reception of Lass-formed images, it will never substant the faculty of reslection. These higher tweets of the mind will lie for ever dormant; and the sole guidance of conduct will be submitted to the impulse of feeling. The consequences of this I need not pourtray; they are, alas! too glaring, and occur too frequently, to stand in need of animadversion.

perverts the intentions of Providence, by preventing the expansion of the intellectual forunces: it buries the most precious gifts of Heaven; and, by sowing the seeds of raide and presumption, it scatters vice and only throughout the world!

may be thought very bold in attemption of overturn the established laws of address; those laws by which the generality tents are guided in the system of education. But however submissive to her defects of subjects of taste, I have been early upon, that neither reason or conscience upon to yield to her authority.

in my opposition in the present instance the like of the present in the present instance in the left in the like of the like of modern education the bright weapons of wit and eloquence, enforced by the strong arm of truth and reason.* All I can advance upon the subject, will prove

^{*} See Mrs. More's Strictures on Female Education.

When little mifs, or little mafter, come home from fehool, we are stunned by the recital of their accomplishments. They are all skilled in languages, and expert in science; all equally favoured by the Muses and the Graces. Nothing can equal the de-

light which a benevolent mind experiences in the contemplation of such perfection!

It w rapidly," it is inclined to think, and knowledge and virtue be diffused to oughout the world, when these tender to allow of wisdom shall have ripened to accurity! See the blest effects of strew the path of learning with flowers!

It is a formerly cost years of attention and perfeverance, is now accomplished in less than as many months. Surely, we have very much improved upon the method of our forestatiers; and of these improvements the next general perfection will refer the himself.

my Friend, we have improved upmy wifdom of our anceftors, pretty much in the fame manner, as he who should exchange an oak wood for a grove of Lombardy poplars; and if we lay aside all idea of durability, strength, and utility, the young poplar will, I acknowledge, claim the preserve. But when we come to apply the one and the other to useful purposes, we shall have no reason to think ourselves gainers by the exchange.

Every thing in nature teaches us, that whatever is intended for strength and duration advances by flow degrees to maturity. The human mind, in this respect, obeys the same laws as the material world; and as nature, though slow, is ever operative and vigilant, we surely ought; when we attempt to act the part of her affishants, to follow her plan, and be guided by her example.

In our vain attempts to overturn the order of nature, by prefenting objects and pursuits to the mind, which demand the exertion of faculties of which it is not yet in possession, we are guilty of a double species of imposition. We impose upon our pupils, by making them conceive that they get ideas of things, on which they have, in reality, no ideas; and we impose upon ourselves by their seeming progress—

an imposition which is greatly aided by the facility with which the found of words is committed to memory in early life. Thus, when the paying any attention to the cultivation of the first and fundamental faculties, we flatter ourselves that we have abridged the path to wisdom and knowledge; while, a reality, we have been leading them from it, in the direct road to conceit and a presence.

When we confider that the exercise of strenton is absolutely necessary towards strenton is absolutely necessary towards strenton in the stown difficult it is to rouse a tempton in the slow, and to check the rouse acception of ideas in the quick, so as to give attention leave to operate; we shall become e, that a multiplicity of things to be learned at once, must inevitably tend to retard the progress of the faculties. Those who have experienced how difficult it is to give just, and clear, and distinct notions to a child, upon any subject which is not the

of its learning many things well at the fame cifed; the words will be feen, they will be employment, the more will the develope-

This leads to the queries with which my last letter concluded. Is it proper to restrict the exercise of memory in child-hood to subjects whereon it has acquired just and accurate notions? Is it never to be exercised upon words, of whose mean-

ing it has no diftinct ideas? I should be forry to be so understood. I think the memory may be exercised with great adaptation in childhood, upon words which the memory may be exercised with great adaptation in childhood, upon words which are the mind; but these are words which are the mind; but these are words which are to be made use of; they are the period, to work. Such are the rules of sammar; the terms made use of in the caces, which are to form a part of some studies; and, in short, all those period, and thus abridge into separate period, and thus abridge the labour of the run and arrangement.

trey one, who at an advanced period of the has attempted to instruct himself in any branch of science, must be sensible how much the difficulty is increased, by the loss of the aptitude, which memory has in early life, for retaining mere perceptions. What is clearly conceived upon the subject, the

memory faithfully retains; but it is not without great and repeated efforts that the necessary terms come to be familiarly recollected. I have known several persons, who have been by this difficulty deterred from the pursuit of botany, chemistry, and other sciences, for the acquirement of which they felt the most ardent inclination. Had the technical terms belonging to those sciences been committed to memory, at that period of life when words (that is to say, perceptions) are received with facility, and recollected with ease, the sciences I have mentioned would have been attained without the smallest difficulty.

The grammatical rules of every language come exactly under the fame description. Persons to whom these rules have been familiar from the period of infancy, easily acquire the habit of arranging their words with propriety; while those who have not at an early period made this acquirement, though by the study of philosophical gram-

mar, they may attain a perfect knowledge of its principles, yet will they in practice be frequently at a lofs, and often liable to error. I candidly confefs, that I fpeak this from my own experience; and am fenfible has more perfect acquaintance with the more of grammar, acquired even by rote morely life, would have faved me many a partful hour of future study.

are, then, have I prefented you with a relefield for the exercise of the memory perceptions. But deceive not yourself; sective not your child into an opinion that has obtained any knowledge from these percises. Let them be looked upon as they really are—mere materials, which are really are—mere materials, which are real use they will certainly be found; be made use of at the proper period. For real use they will certainly be found; will be as well-tempered mortar in the temperature of the solution of the solid edifice. But you must not so far mistake, as to consider this mortar as the building; if you do, the intellectual fabric will never be reared.

It is, I believe, a very generally received notion, that a taste for poetry is inspired by the recitation of verses. Let us examine in what this taste consists.

allufions are lost for want of conceptions to apprehend their meaning; where the finest imagery presents no object to the mind; the emotions that are excited have surely no affinity to the sublime or beautiful. Even in descriptive poetry, unless the objects have been samiliar to the perceptions, it is impossible that the most just and beautiful description can convey any ideas to the mind.

Let us suppose a little girl, whose acquaintance with natural objects extends to the grass-plat which ornaments the centre of some neighbouring square. In order to cultivate a taste for descriptive poetry, she is enjoined the task of getting by heart Gray's celebrated elegy, which abounds in imagery at once natural and affecting. Let us follow her in the conceptions she forms from it. Two lines will be a sufficient example:

[&]quot; The curfew tolls the knell of parting day,

one may wind a clock or a watch either flowly or quickly; and with that idea she probably affociates it, passing the succeeding words of o'er the lea as mere expletives, placed there by the poet to lengthen out the line; for which purpose twedle dee would, to her conception, have done every whit as well.

I could thus go through the whole poem, and think I should leave no donbt upon your mind at the conclusion, that the child had received as many ideas from this exercise of memory, as she would have done from the repetition of any old rhyme.

Where the perceptive powers have been fufficiently exercifed upon natural objects, fo as to render the greater part of a poetical description intelligible, great advantage may indeed arise from the perusal; because, in that case, the pleasure which the mind receives from seeing the images with which it has been familiar, set in a new, and more elegant, and elevated point

stimulus to the acquirement of new ideas.

I well remember how eagerly I caught the information, that bells were worn by England. The cuftom was unknown in

simple superstitions of the peasantry were known to me; I had frequently heard their origin explained, and their folly pointed out; but the colours thrown over them by the charm of poetry presented them to my view in a new and interesting light.

attention to all the images which are material world that all the finest imagery

of the poet is derived. From the same source we have all our ideas of the sublime and beautiful. The descriptions of the poet, by calling our attention to these objects, increases the emotions which they have a natural tendency to excite; and thus a taste for poetry enhances the pleasure we derive from contemplating the beauties of nature, while an accurate knowledge of natural objects gives to poetry a peculiar zest.

It is, then, from a cultivation of the perceptive faculties, that we only can attain those powers of conception which are essential to taste; and without this cultivation, all the beauties of all the poets who have ever written, committed to memory, would do no more towards inspiring poetical taste, than the smell of a rose would do towards giving an idea of its colour to one who had been born blind.

From the tenor of these observations on the cultivation of the perceptive and conceptive

conceptive faculties, the advantages of a country education in the early part of life will appear fufficiently evident. Those who advantage to their children; those whose benefit of an extensive and familiar acquaintance with natural objects, ought to amends for this misfortune, by feizing every opportunity of directing their attention to the natural objects within their reach. If the vegetable world is thut to is open before them. If "the various " landscape bursts not on the fight," the fun, moon, and flars, may still be feen. works of art to be neglected. In most of thefe, fome principles of science are inwhich are just and accurate, ought we to overlook.

I have incurred the risk of wearying you upon the subject of accurate conception, because I believe that it is but little attended to by the instructors of youth; and I would rather tax your patience by prolixity, than leave any thing unfaid which could tend to enforce the belief of its importance. That importance will still appear in a stronger point of view, when we come to consider the faculty of Judgment, which shall be the subject of the next Letter.

Adieu

LETTER VII.

JUDGMENT

First begins to operate upon the Objects of Perception.—Necessity of exercising it upon sensible Objects.—Illustrations.— How it may at first be exercised on Moral Propositions.—Party Prejudice inimical to its Cultivation.—Observations on this Head.—The Use of History.

MY DEAR FRIEND,

A Sall the errors, and many of the vices, of mankind originate in a deficiency or perversion of the faculty of Judgment, we are called upon for a very particular attention to its cultivation and improvement. By tracing the progress of its gradual developement in the human mind, we shall perhaps be enabled to exert our own judgment to advantage, in determining on

the steps most proper to be taken for the cultivation of this important faculty; while by observing the obstacles frequently opposed to its improvement, we shall perceive the reason of its seldom attaining maturity.

It evidently appears, that Judgment begins first to operate on the perceptive faculties; and that till the commencement of this operation, the mind is incapable of improvement from the objects of sense. The knowledge that is obtained of the relative distances of visible objects, is an operation of judgment: even in the belief of the existence of such objects, judgment is concerned. And this consideration ought to make us particularly careful of milleading the tender minds of infants into erroneous judgments, concerning the powers and properties of the objects with which they are most conversant.

"If you touch that flick, it will be angry, "and beat you," fays the foolish nurse. The slick is taller than you are, fays

the more fensible mother, 'and if you 'bring it upon you, it will hurt you.'

It is by means of judgment, that a child is gradually made fenfible that the prefence of objects does not depend upon his perception of them. To the infant the object is no longer prefent than it is vifible to his eyes. The powers of conception and judgment must both have exerted their influence, before he believes the contrary; and by what slow degrees their influence is exerted, is obvious; as we see children of two or three years of age, who, when they cover their eyes, imagine they are securely forcemed from observation.

If we attempt to force the progress of judgment at a very early age, we shall only weaken its powers; if we are always ready in every little instance to interpose our own, so as to forestall the judgments of the child, we shall teach it to rest upon authority, and the faculty of judgment will probably be little exerted through life.

It ought, therefore, to be our business to lead and affilt the judgment, so as to render it strong and vigorous, rather than to impose upon it the dictates of authority. By pointing out to children the erroneous judgments which they form upon the trifles within their sphere, we shall not only improve their powers of judging, but make them sensible of the advantage of implicit obedience to those who are capable of so much more discernment.

A child confiders its painted toy as a whole; it has no notion of its parts, properties or attributes. It is told, that by wetting it it will be deftroyed. Unmindful of your warning, it drags it through water; the paint comes off, the glue diffolves, and the whole fabric is demolished:

"Did I not tell you, you little michie"vous monkey, that it would be destroyed!
"The little coach knew that you were
"naughty in disobeying me, and it went
to pieces."

Charming

Charming leffon to the judgment this! much is it likely to improve under fuch management!

" Come to me, my little fellow, and I " will let you fee my reason for warning " you against wetting this toy. You fee, in the first place, that it was made up of se feparate pieces of wood, which, being " cut into the proper shape, were joined 66 together by means of a little glue; now 45 this glue or cement dissolves in water, " fo that you fee the reason of its coming " afunder as foon as it was wet. Let the se pieces be dried, and you shall have a 66 little cement to fix them together again " yourfelf. You know that the wood was "at first white, like the colour of the " boards of the floor; but when the coach was made, the toyman put a little paint 4 upon it, which being ill made up, and " flightly laid on, was eafily washed off. 46 And now you fee, my dear, how I came to foretell the confequences of putting " your toy in water."

[200]

Not a day, fearcely an hour, paffes, in which a judicious and attentive mother may not find opportunities of improving the faculties of judgment and conception in her children. The great point to be attended to is the co-operation of these faculties in every point which she explains. If she goes beyond their reach, they will never be exerted. If she does not discriminate, she will, in her attempts at instructing the infant mind, be only giving a confused and indistinct knowledge of facts, instead of cultivating those faculties by which alone real and useful knowledge can ever be acquired.

"Some are born to greatness, some at"chieve greatness, and some have greatness
"thrust upon them," fays Falstaff; and so
it is with learning. It is too often thrust
upon children; and where it is so, we may
venture to affert that greatness will never
be atchieved. A truly great and comprehensive mind was never yet formed by
artificial

artificial means. In order to effect the compleat and perfect development of the intellectual bloffom, we must defend the bud from canker; we must expose it to the genial influence of the sun of reason; we must nourish it by truth, and promote its expansion by fertilizing the foil; but if we forcibly tear it open, we may bid adien to all expectation of fruit.

Of all the faculties, that of judgment is most effentially injured by the injudicious speed of our career in modern education. The judgment, indeed, has no time to operate, no opportunity for exertion. Every thing is presented ready-made, if I may use the expression, and the pupil has nothing to do but to cloath its memory with the garments provided for it; and where these are deficient, it must put up with the deficiency, for it has no materials wherewith to weave any for itself.

The propositions upon which it is the province of judgment to exercise its power,

are all in their natures either true or falle; and whether they be true or falle, it is the business of judgment to ascertain. By having been frequently exercised upon those in which its conceptions were affisted by the fenses, it comes by degrees to be prepared for deciding upon those which are formed from ideas in the mind, the patterns of which are no longer present to the fight.

Thus a child whose conceptions have been exercised upon numbers, so as to have acquired clear and distinct ideas of what is meant by one, two, three, &c. will more easily perceive the truth of the proposition, that three times three are nine; than a younger child, whose conceptions have not been thus exercised, will perceive the truth of the proposition, that one and one make two. To enable it to form a judgment upon this, it must have clear and distinct conceptions of the meaning of the words; and added to that, the judgment

must be affished by the perceptions; for without visible or tangible objects, no knowledge of numbers, or judgments upon them, could be acquired.

In learning the power of numbers, the judgment is much improved, provided that the judgment be permitted to be duly exercifed. But if we only aim at hurrying the pupil on as fast as possible through the rules of arithmetic, that we may be able to boast of its astonishing progress in having got to the Rule of Three, while others of the fame age have not proceeded beyond fimple Addition; the memory will probably have been the only faculty exercised throughout the whole process. Throughout the whole course of education, children are great fufferers from our having forgotten the process by which we ourselves acquired the knowledge we now possess. The intermediate ideas which ferved as links in the chain of our original conceptions, have fled from our recollection; we,

therefore, never think of prefenting them to the minds of our children: and yet without these connecting ideas, it is impossible that we should ever succeed in communicating instruction.

For the flow, the fleps of the ladder should be shortened; and we ought to afcertain their having firm footing upon one, before we urge their progress to another. For the quick, fewer steps will serve; but these ought to be examined with accuracy, so as that they may be retraced with certainty and precision; otherwise the pupil will be in danger of hurrying with precipitancy to the top, and then slying off to some other object; and will in vain endeavour to find again the way over the same ground.

Every judgment which the mind forms, is a diffind flep in the path of knowledge; and the abfurd attempts which are made to lift children at once into the regions of fcience, are no less ridiculous, than would be our endeavours to make children walk

with eafe and gracefulness, by always carrying them in our arms. The use of the mental faculties, as well as of the limbs, must be acquired by exercise. Such is the law of nature, and we never gain by opposing her authority.

I have known children, who, from the time they could fpeak, had masters upon mafters to instruct them; and what was the confequence? Mere prate; many words and few ideas. Let us suppose one of as I have before observed, may be made an useful means of strengthening the faculty of Judgment. It is taught to repeat after the mafter, " five and two make " feven; feven and feven are fourteen," and fo on; till, by frequent repetition, the Addition tolerably well. Next comes the Multiplication table, which it learns by rote, and applies in the fame way, as often

「 206]

as it is wanted. And so on through all the rules, the master affisting all the time whenever the pupil is at any loss, but never attempting to unfold a principle, or to give a single idea upon the subject. I speak from experience, as it is the way in which I myself was taught, and as I believe many others are.

Let us now suppose a child, whose conceptions have been gradually improved by the unceasing, though almost imperceptible, efforts of a judicious and attentive parent. She marks the time when ideas upon the subject of numbers may be given with effect. She seizes the most proper period for beginning her instructions, or rather for leading the mind to instruct itels. By frequently recurring opportunities she exercises the conceptions and the judgment upon units. She renders all the different combinations that can produce numbers under ten, familiar to these faculties; and then proceeds to add ten to ten, till the conceptions

conceptions can embrace hundreds. Tables of numbers are then given to be fummed up, and at every step the judgment is taught to decide on its truth and certainty. Multiplication is explained as a shorter method of Addition, and its principles unfolded in plain and eafy terms. By frequent exercife, the mind becomes fo familiar to the fubject, that its knowledge appears intuitive; its ideas are all clear and accurate; and although the rules may not be gone through with a tenth part of the speed, with which they were galloped over in the former instance; we cannot doubt, that when both pupils come to put their knowledge into practice, the latter will have a great and manifest advantage.

How, indeed, in the former cafe could the poor child possibly acquire clear ideas upon any subject, when it probably had twenty things to learn at the same time, all opposite in their natures, calling up different trains of ideas, and requiring different tones of mind? It is likewise probable, that in the high encomiums it has heard bestowed on those ornamental accomplishments which are deemed so necessary to a person of rank, it has learned to affeciate ideas of vulgarity, and consequently of contempt, to a science, which is peculiarly necessary to people of business. By these false affociations the judgment is perverted at a very early period: and of these false affociations the parent must divest hersels, who would have her child possessed of a found mind and vigorous understanding.

The conduct of life requires no less accuracy of calculation than the conduct of business; and the science of numbers, from first to last, being that which furnishes us with the most distinct ideas,* is of the

[•] The fumple modes of number are of all others, the most difficult; even the leaft variation, which is an unit, making each combination as clearly different from that which approacheth nearest to it, as the most remote: two being as distinct from one; as two hundred;

utmost importance, not merely to the merchant and accomptant, but to every rational being. It ought besides to be considered, that the mind makes use of number in all its ideas of duration and extension. Our ideas of infinity, with regard either to time or space, are nothing but the infinity of number. Those whose ideas concerning the powers of number are faint and consused, will be found to have very consused and inaccurate ideas upon many other subjects.

In the education of boys this is, perhaps, fufficiently attended to; but why our own fex should be so utterly precluded, as they

and the ideas of two being as diffinet from the ideas of three, as the magnitude of the whole earth is from that of a mite. This is not the cafe in other fimple modes, in which it is not fo eafy, nor perhaps possible for us, to diffinguish betwixt two approaching ideas; for who will undertake to find a difference (in his conceptions) between the white of this paper and that of the next degree to it? or can form diffinct ideas of every, the least excets in extension.—See Locke on the Human Underslaudies.

generally are, from this most useful branch of knowledge, can only be accounted for tion, which renders every thing that wears ful to us. Hence it comes, that whatever run over, in female education, that it appears as if judgment were a faculty which could have occasion for. A little reflection upon this fubject would furely convince us of the contrary. A little reflection would teach us, that in every fituation in which a female can be placed; whether she be free or subordinate; whether she moves private; abroad or at home; judgment is

[211]

and direct her conduct, she will become an object of contempt.

Beautiful imbecility will be admired, it is true; but let us apply to numerical rules, and calculate the period of this admiration. What proportion does it bear to the length the advantages to be derived from it, when compared with those which would be experienced in the capability of fulfilling, with honour and propriety, the duties of a wife, a mother, the mistress of a family, the prudent adviser, and the faithful friend? Is it acting with wisdom and consistency, in the first place, to do all in our power to and then to plunge them into fituations where its exertion is absolutely necessary? This is the argument, (and an unanswerable one it is) which can alone be used with propriety by the advocates of the frail fair ones, when pleading in extenuation of their foul offences in our courts of justice.

[212]

Were this argument to be adorned, as it might, by the eloquence of an Erskine or a Garrow, it would do more towards opening the eyes of the public to the consequences of an education merely ornamental, than all that can be written upon the subject by the divine or moralist.

Let it be represented to the juries, who are called (alas, fo often!) to pronounce upon the heinous conduct of shameless matrons, that the creatures, whole crimes are thus exposed to public fcorn, can fcarcely be deemed accountable agents; fince, in our ideas of accountableness, rationality is always included. Now ample proof can be brought, that from the cradle upwards every possible pains have been taken to destroy the rational faculty. Without judgment, there can be no knowledge of firk principles; without first principles, there can be no rule of conduct or of duty. How, then, can creatures be faid to transgress against principles which they never had it in their power to comprehend? They were taught, that the fole duty of woman was to be amiable. That in order to be amiable, they must be accomplished and genteel; that is to fay, that they must learn to dance, and drefs, and " nickname Gop's " creatures;" to talk fentiment, to affect fenfibility, and to follow fashion into whatever follies she may lead. Have they not done all this? And now mark the inconfistency of man! They are accused of finning against the laws of God and of their country; when they can call Goo, their country, and their parents, to witness, that their judgment was never fufficiently cultivated to pronounce upon the truth and propriety of a fingle precept, moral or divine! They were taught to look on perfonal admiration as the chief good; when they found it was no longer to be expected from the husband, were they to blame for feeking it in the admirer? Of all that they were taught to believe amiable, they are

ftill possessed; for no one estimable quality of the heart and understanding was in the catalogue! Sensibility or sentiment comprised their only notions of virtue; and by giving way to sensibility and sentiment they became adulteresses; or to speak in the more delicate terms of modern refinement, amiable unfortunates.

To the effects of a pernicious education, and not to the frailty of the fex, ought the natural confequences of a want of principle to be affigued. Such a change in the mode of education as would expand the powers of intellect, enable the mind to embrace truth, to perceive the utility and advantage of moral rectitude, and to regulate the paffions and affections of the heart by the laws of piety and wifdom, would do more towards putting a ftop to the career of vice, in every rank and flation in fociety, than all the laws and punishments the legislature can devise. Pardon, my Friend, pardon, I besech you, a digression into

which I have been unwarily hurried; and leaving the amiable and accomplished frail ones to reap the fruit of the erroneous ideas they have imbibed, let us turn to the confideration of the judging faculty, by the due cultivation of which these fatal errors in conduct may happily be avoided.

Having first exercised the judgment by means of the perceptive faculties, it gradually becomes ripe for perceiving the truth of propositions, the subjects of which are not immediate objects of sense. The proposition, for instance, that the same cause will always produce the same effect, though the foundation of our reasoning in many sciences, as well as in morals, is first made clear to the understanding by means of the sense. To render the conceptions upon this, and similar propositions, clear, distinct, and accurate, is, I believe, of much more importance, than is generally imagined. In the words in which I have delivered the proposition, a child would not apprehend

meaning: But shew him, that while he ftrikes his ball against the wall with force, it will always rebound with proportional activity; and that when he throws it gently, the re-action will be proportionably weaker; he will foon understand your meaning. You may make him fenfible, by a thousand familiar examples, that the fame law extends throughout all matter, and that wherever there appears any variation in the effect, from causes apparently fimilar, we may be affored, that the fimilarity is only apparent, but that, in reality, the cause is different. Such instructions tend to awaken and keep alive attention, while they preferve the mind from vulgar prejudices and fuperstitions; which all originate in confined views, and want of accurate observation. The effect they have in strengthening the judgment, is evident from the conduct of those whole judging faculties have never been thus cultivated. Propositions, which appear intuitive to others, feem abfurd to those whose conceptions are habitually dull and languid for want of cultivation; while the judgment that has never been exercised on the objects of perception, takes every thing for granted without examination. Hence that credulity, with regard to the marvellous, which is a differace to the enlightened age in which we live.

When a child has had the connexion betwixt cause and effect sufficiently impressed upon the mind by means of exterior objects, it will more easily comprehend the application of the same principle to morals.

That a want of veracity produces loss of confidence as its inevitable confequence, is a truth of which the judgment may be made fensible at an early period; and indeed, while this faculty is uncorrupted by felfishness, it will feldom fail to decide with precision on every point of justice. Easily may the judgment be led to perceive that good-nature and affectionate dispositions produce, as their effect, complacency

and affection in the breafts of others; that esteem is the natural consequence of integrity, wifdom, and benevolence; and that all the malevolent and diffocial paffions beget displeasure and hatred. But in order to fix these affociations in the mind, it is absolutely necessary that the conduct of the parent should give invariable testimony to their truth. If the fame conduct in the child be at one time found fault with, and at another gets leave to pass unnoticed; if praise or blame are bestowed not according to defert, but according to prefent humour, blishment in the heart. Following your example, your child will learnto like and without being at any pains to merit efteem,

You will, perhaps, object, that happiness and the world's effect are not always the

inevitable refult of virtuous conduct; and that by teaching children to expect them as certain effects, we should lead them into error, and expose them to mortification.

To this I answer, that though envy and malignity are apt to detract from merit, this very detraction shews a consciousness that esteem and approbation are the natural consequences of virtuous conduct; and that it is in hopes of obstructing this natural effect, that malevolence exerts its influence. Should it unfortunately succeed, it can only succeed with regard to our fellow-mortals. A powerful argument for endeavouring to approve ourselves to a higher power! A convincing proof of the inefficacy of all moral systems, that rest not on a more solid soundation than the applause of those who are frail and liable to error!

Seldom, however, even from our fellow men, is the pure and upright conduct of the humble and the worthy denied the meed of approbation and efteem. It is

wher

when we folicit the praise of the many, and not when we wish for the esteem of the good, that we are liable to disappointment. This observation receives ample support from the records of history and the annals of private life. Never, in all our refearches, shall we find an instance, where unostentatious benevolence, justice, wisdom, and piety, were refused the esteem and approbation of mankind, unless where party hatred, by its deadly poison, blinded the eyes, and envenomed the heart. By this was Saviour of the world! By this have many who call themselves his disciples, been enflamed to cruelty and vengeance against their more deferving brethren.

The analyzation of party spirit can never take place in the moment of fermentation; but when that has sufficiently subsided to permit us to examine it minutely, it will appear compounded of fear, hatred, pride, envy, malice, and cruelty. As it operates most violently upon ignorance, there can

be no better prefervative from its attacks, than a firong and cultivated judgment, together with conceptions so clear, acute, and accurate, as to embrace the whole of the arguments, and to perceive the whole of the errors, on both sides of every question that is agitated.

Nothing can be more inimical to the cultivation of judgment, than an early initiation into party prejudices. By these the conceptions are missed, and the judgments concerning right and wrong must consequently be often erroneous. To approve or disapprove according to the distates of affection, rather than of principle, is at any time of life stall to the integrity of the moral character. The habit of doing so is to the young particularly injurious: it not only warps the judgment, but depraves the heart.

Did the cultivation of judgment once become an object in female education, the zeal of fair politicians might, perhaps, suf-

[222]

fer fome abatement; an evil that would not probably be productive of any very fatal confequences to fociety. Unbiaffed judgment will perceive, that wifdom dwells with moderation, and that firmness of conlence of fentiment. Cultivated judgment will not produce indifference to the interest nor will it lead the mind to be contented with profound ignorance concerning the nature and origin of points which are the objects of political dispute; but it will reftrain wrath, and keep the individual in the Were the judgment to be exercised in findthe rugged spirit of resentment; to allay

[223]

the fervour of ambition; and to check the cruelty of revenge; would, to enlightened judgment, appear as the peculiar duty of those, who, not being called on to take an active part, are, by this neutral fituation, marked out as the mediators and peacemakers of society!

Let us ourselves acquire, and let us endeavour to give our children, such clear conceptions upon the subject, as may leave them at no loss to pronounce on the confequences of a conduct marked by benevolence, wisdom, and moderation; in opposition to the effects produced by violent prejudice, blind zeal, and cruel intolerance.

History presents us with an instructive portrait of the human passions; but it is of the passions principally as they are actuated by ambition. Without previous care to strengthen the judgment, History, therefore, by the interest which it excites in the fate of heroes and conquerors, may be instrumental in awakening ambition, and

kindling the flame of false glory in an ardent mind. The historian who does not catch a portion of his hero's spirit, and enter with warmth into his interests, will be cold and inanimate. He who does, will be apt to throw false colours over actions that are in their natures hale and vile; to extenuate what is reprehenfible; and fometimes to extol what is undeferving of fober approbation. Thus are the moral notions of youth in danger of being corrupted, from the very fources which we improvement. This, I believe, to be often the case with boys; and is the inevitable to get the flart of judgment. Were the toric page; the ardent youth, instead of being dazzled by the false lustre of splendid atchievements, would purfue their confequences to the human race, and fee

wide-fpread ruin, pain, mifery, and devaltation, the awful price of short-lived glory.

The various advantages accruing from the study of history are too numerous and too important to admit of being fully decribed in fuch an imperfect fketch: fuffice it to fay, that under the direction of a judicious preceptor, it cannot fail to enlarge the conceptions, to increase the number of ideas, to improve the judgment, and to strengthen moral and religious principle in the heart. The mere knowledge of dates and epochs, of the names of fovereigns, and the length of their fuccessive reigns, and even of the principal features that marked the character of every prince, and of the most remarkable events that took place in every age, will go a very little way towards intellectual improvement. This is the knowledge and the fole knowledge that can be obtained from abridgements. From these, therefore, none of the moral uses of history can possibly be derived.

VOL. II.

The

The affociations they give are merely those of time and place, which, as we have already seen, are the only affociations familiar to the vulgar. Abridgements of history are merely to be considered as exercises of the memory; and whoever expects by their means the improvement of any other faculty, will be miserably disappointed.

Are, then, abridgments of no use? To the young, I certainly think, they are of none, and worse than of none; for I deem it much safer for the mind to be destitute of all ideas upon any subject, than to have those which are confused and indistinct. But to such as have in youth laid in an ample fund of information, when that information begins to sade on the memory, abridgments may be found of great service. They give the outlines which the mind is in possession of materials to fill up. Every event which they record, awakens a chain of affociations, and revives ideas which had

become in a manner extinct. To the learned, therefore, ought the use of abridgments to be confined; while to the minds that are on their progress to improvement, full, clear, distinct, and accurate ideas ought to be given upon every subject proposed to their consideration.

Here again we may observe the confequence of that impatience and precipitancy which in fo many instances defeats the great purposes of education. By our impatience to make our children perfect in knowledge, we in reality present an infuperable bar to its acquirement. We cramp the powers of the foul, and leffen its capabilities. We teach it to fkim the furface of science, and indolently to acquiesce in fuperficial attainments. Thus we produce a race of praters who know nothing; of talkers who never think; of light, trifling, and fantastic beings, alike destitute of intellectual vigour and of folid principle. You, my Friend, who live in bleft retire-

[228]

ment, fee little of this. Let those who are conversant with what is called the aworld, pronounce upon its truth!

Adieu.

LETTER VIII.

JUDGMENT.

Observations upon the Method to be pursued in reading History.—Premature Cultivation of Imagination hurtful to Judgment. Other Obstacles to its Improvement examined.—Mode of Female Education formerly adopted, more favourable to Judgment than the modern.—Examples.

YOUR observations, mydearest Friend, convince me, that I have not sufficiently explained myself, with regard to the use of history in early education. My objection to abridgments does not, as you suppose, extend to those little nursery catalogues of kings and queens, whether in verse or prose. I think, on the contrary, that such chronological epitomes, committed to memory

to memory at that period when words are most easily retained in it, may be of great advantage. This can never be mistaken for a knowledge of history; which, I fear, a superficial acquaintance with the contents of larger abridgments very frequently is. You say that "it is impossible for child-"ren to read voluminous histories at a very early age;" and I entirely agree in your opinion.

I fpoke of history, as affording striking examples of the truth of the proposition concerning cause and effect, upon which I supposed the judgment to have been for some time exercised. From the whole scope and tenor of my argument, it will appear sufficiently obvious, that I adopt, as a fundamental principle, the impossibility of any exercise of judgment, where there are not clear and distinct conceptions. But there may be very clear and distinct conceptions of the causes and consequences of particular events, and the mind may be

capable of forming very just and accurate ideas concerning particular instances of human conduct, long before it is capable of embracing a series of complicated and successive events. Long before it has strength to wield the massy chain, it may be capable of examining an individual link.

Hence it appears to me, that the judgment will be exercifed to more advantage, by a minute inveftigation of a detached period of hiftory, judiciously chosen, than by the perusal of the abridged hiftory of ages. Fully apprifed of the narrow limits of its information, the mind will be in no danger of that shallow conceit which constantly attends the superficial. It will be prompted to acquire further knowledge for itself; and by having been put upon the method of exercising judgment upon every subject it investigates, its enquiries will never fail to be attended with advantage.

Against the morality of the tales of instruction now in general use, I make no objections objection; because, whether these sistinous representations of events be moral or otherwise, they are alike inimical to our design of cultivating the faculties according to the order in which they are developed by the hand of nature.

I hope I have made it plainly appear, that judgment is coeval with the faculty of conception; and that both faculties must be cultivated by means of the external fenses. But fancy or imagination has a distinct and peculiar province; and I shall endeavour to shew, that if judgment has not been fufficiently strengthened before the powers of fancy are called into exercife, there is little reason to hope that the faculty of judgment will ever afterwards attain perfection. Now, by far the greater number of entertaining flories which I have ever read, are addressed folely to the imagination. They may produce fenfations favourable to the cultivation of the affections; but the judgment, fo far from receiving any improvement from their perufal, must be lulled asleep, before the fancy is fufficiently awakened to follow the story. viously exercised upon first principles, so as and effect, it will be competent to decide on the probability or improbability of fupposed events; and from the impulse of the contemplating the laws of poetical justice. But where the vain attempt is made to imprefs first principles upon the mind by nation, the judgment will take no part in the decision. By a succession of these interesting tales, the minds of the quick and ardent will be filled with wild and incoherent images, false affociations, romantic ideas-and imprudent conduct will be the certain refult. Nor will the confequence be less faral to the flow and indolent: confcious of the languid flow of their ideas, they have much gratification in whatever, without exertion on their parts, accelerates their course. To children of this description, therefore, books of amusement are thought particularly useful. But would we give ourselves the trouble to examine a little farther than the surface, we should be convinced, that the great object with respect to such minds is to rouse them to an active exertion of their faculties; whereas, by merely following the tale of fancy, they indulge the inclination to indolence.

While I thus express my disapprobation of those fictions which stimulate the imagination, while they retard the operation of judgment; it may be necessary to say something of those which are addressed to the judgment, and manifestly aim at its improvement. Fictions of this nature are nothing more than examples tending to elucidate propositions submitted to the judgment, by placing them in a conspicu-

ous point of view. They ought, of neceffity, to be fimple, clear, and perfpicuous. Such were the parables by which our Bleffed LORD vouchfafed to inftruct his unenlightened auditors; every one of which will, upon examination, be found to be exclusively addressed to the judgment. Let the learned reader compare with these the wild sictions of the Koran, which are all addressed to the imagination; and while he sees in the former the manifestations of Divine wisdom, let him be careful not to follow the method of instruction of which the latter is a model.

To educate youth by means of pretty flories, though a fystem which has been but lately introduced into this country, has been for ages practifed by all the Oriental nations. Let us look to its effects on the inhabitants of Asia. What vigour of intellect, what strength of genius, has it there produced? Let us behold its operations in the imbecility and indolence that marks the

Eastern character: and with such glaring proofs of its satal consequences before our eyes, let us beware of enseebling the minds of the rising generation by a similar procedure.

The fwarm of heterogeneous abfurdities that daily iffue from the prefs under the appellation of Novels, would (if any had fufficient command of patience for inveltigating their contents) afford the most convincing proof of the effects produced upon the mind by calling forth the imagination, while the powers of judgment are fuffered to lie dormant. In these writers, we behold the powers of fancy employed in making the most abfurd combinations from the few confused and inaccurate ideas they happen to poffefs. We fee invention on laws of nature violated; the course of the passions misrepresented; the principles of morality fet at defiance; and the whole

mixed up with a jargon of fentiment, which is incomprehenfible to plain common fense. Yet so voracious is the appetite for novelty in those who have never been taught the exercise of judgment, that such books are read, aye, and none but such, by numbers of young women, who hope in due time to become the mothers of hopeful families!

The train of ideas introduced into the mind by the hyperbolical language of fiction, is found fo agreeable to the young, fo favourable to the indulgence of that luxurious indolence, to which most have fome propensity; that it is no wonder that minds, to which such trains of ideas have become habitual, should find it difficult, if not impossible, to turn the current of thought into other channels. Now nothing can be more evident, than that every process of reasoning, whether on the nature of material objects, or upon subjects of speculation, requires a feries of distinct and clear ideas; and I leave it for you to

decide, whether it is by accustoming the mind to the train of thought produced by fiction, that it can be best prepared for this exercife of the intellectual powers. that minds, which, instead of having had the perceptions exercised on sensible objects, and the powers of conception and judgment gradually unfolded by the fame means, have been taught all they know through the medium of the imagination, will never through life exercise any other faculty? All the ideas of right and wrong, just and unjust, probable and improbable, will be tinged with the false colouring imperceptibly received from the train of ally paffing through the mind. But where the reasoning powers have been habitually exercised on adequate objects, the train of ideas, which occupy the fancy, will no longer be of the nature of unprofitable or pernicious visions; they will be the parents

[239]

of genius, of invention, of exalted purpoles, of good resolutions, and of meritorious conduct.

The cultivation of judgment, fo far from presenting any obstacle to the enjoyment of the pleasures of imagination, is absolutely necessary towards their being enjoyed in any fuperior degree. Who would compare the pleasure enjoyed by a cultivated mind in perufing the exquifite compolitions of a Homer, a Shakespeare, or a Milton, to that which a novel-reading Miss receives from the eventful tale that beguiles her of her midnight flumber? Nay, laying thefe higher works of genius out of the question, let us suppose two young people employed in reading one of Miss Burney's admirable pictures of life, (which for want of an appropriate term, likewife go under the denomination of Novels) and that one of these young persons has had her mind furnished with ideas, her conceptions vigorous and acute, her judgment

ftrengthened by exercise, and her affections governed by the well-examined principles of moral restitude; -while the other, instructed by means of fiction, has had her fenfibilities exercifed while judgment was weak, her ideas few and confused, and her the story with equal ardour. But in the course of the perusal, how many sources of pleafure are open to the one, which, to the other, are totally unknown. With marks each trait of character, enters into the train of affociations by which it is produced, observes how naturally they spring from the situation of the person described; and perceives how jully the author has pourtrayed the inevitable confequences of the conduct to which they lead.

Every fentiment, every moral reflection, powers of judgment. Her vigorous confite emotions of tafte. - A thousand images which have called forth thefe emotions in her foul, have passed unnoticed by her companion. To the fate of the lovers her interest is folely confined, and every thing that protracts the knowledge of their tinent. She receives not from the work one idea in addition to her slender stock; gratified by the denouement, her mind is completely vacated, or only filled with

unprofitable occupy the imagination, they attention as to render its exertion upon

mind is not a failing peculiar to those who are deeply engaged in abstract studies and pursuits; it is common to all who have not had the faculty of attention early and properly cultivated. Where it has thus of life, every topic of conversation, every new object which prefents itself to the eye, every found which strikes the ear, is diffinctly discriminated, and becomes the fource of new ideas; but wherever, by the early exercife of imagination, the mind has reveries, it neither fees, hears, understands, marks, nor inwardly digefts, what paffes around it. Of this absence of mind we and may, at little expence of reflection, be made fully fenfible, that it must present a fatal obstacle to all intellectual improvement. Where the conceptions and the judgment have been early exercifed on the objects of perception, I believe this absence

of mind will rarely be met with. Where they have not been thus exercised, I believe it to be inevitable.

Supposing that the faculty of judgment has been exercised in your pupil so as to have attained to some degree of strength, it will still be subject to perversion from many causes internal and external, which it is the particular business of the preceptor to guard against. Of these corruptors of the judgment, it will be fufficient for our present purpose to mention those which are most likely to affault it in the early stage of which we now treat; recommending it to the reader who wishes for fuller information upon this important subject, to confult Doctor Isaac Watts, who, in his Essay on Logic, or the Right Use of Reason, has given a very fatisfactory view of the several causes by which the judgment is liable to

I have all along infifted upon the neceffity of cultivating the faculties of conception and judgment, by means of a strict attention to sensible objects. But if care be not taken to point out the fallacy of the senses, or, to speak more properly, to shew the extent of their power, our pupils may be led into many errors by putting too much considence in their perceptions.

By trufting to the evidence of fense, mankind, in the infancy of science, judged the world to be an extensive plain; the sun to be a small luminous body which rose from behind a high mountain, or from the bosom of the ocean, and performed its daily journey through the heavens; and the moon and the stars to be of the same infignificant magnitude as they appeared to the naked eye. And though more enlightened notions concerning the heavenly bodies are now made familiar to children, even in the nursery, than was formerly known to sages; still, by trusting to the evidence of their senses, children are liable to errors of judgment, which, if not attended to, may

lay the foundation of future prejudices. These a truly liberal education will doubt-less destroy. But if once these prejudices have taken root in the mind, it is not by going thro' the common routine of accomplishments that they will ever be extirpated.

It will act with particular force upon minds is only the imbecility of ignorance, or the to exist without a cause. A sensible child will foon be convinced that it is impossible; and the mind cannot be better exercifed in early life, than in discovering the causes of appearances with which it is familiar, but for which it knows not how to account. A boy observes that his top spins as long as it is kept in motion; tell him, when he asks you why it does so, "that it is the " nature of all tops," or that " it spins

" because it is whipped," and you lay the foundation for indifference or credulity. But if, instead of giving these solidh answers, you explain the real cause, and teach him to look out for similar examples of the operation of the laws of gravitation, you will probably be doing the faculty of judgment a greater service than it could have received from the longest and most laborious task.

It may be objected to this, that many mothers have not the degree of information requifite to enable them to communicate fuch fort of knowledge to their children. And is it because they are mothers, that it is too late to obtain it? What motive to the acquirement of knowledge half so powerful, as that which operates upon a mother's heart? This motive, strong as it ought to be in all cases, will become still more weighty, when we consider that another very ample source of erroneous judgment is found to proceed from that

[247]

arrogant confidence which frequently parts. All mothers wish their children to be diffinguished by a quick capacity; but dearly do they fometimes pay for the accomplishment of this wish! Soon does the engage its affections by indulgence-by She is folicitous for the improvement of the genius in which the glories; every ftep knowledge, is a degradation to the mother weight, her injunctions without authority. If it be a fon whom the thus fees exalted to a fuperior, she may, perhaps, be proud rejoice in the world's acknowledging her fon for a man of genius; but if it be a daughter, whom she has thus taught to

look down upon her, deep and many will be the wounds of her heart!

A mother, to be truly respectable in the eyes of her children, must not only be to them as a tender protector, a perpetual folace, and the fource of every joy-but as a guide and oracle; one to whom they are they are at all times certain of receiving light. The mother, who is capable of veneration which is the precious reward instructing them. But is it by the common mode of boarding-school education that fhe is to attain this capability? Alas! no. it is true; and the memory of perception likewife. But what has been done for the effential faculties of conception and judgment? How, without the cultivation of thefe, is the to be capable of communicating instruction to others? Impossible. But is it too late for her to fet about the cultivation of these faculties in herself? The belief that it is fo, is a fatal delusion. Do we not see frequent instances of men who have paffed their youth in idleness, but who, at a period of life when many women are mothers of families, begin to make up for lost time by ferious application to those studies which they had formerly neglefted? Do we not fee fuch men fucceed in their attempts? Do we not fometimes fee those who were at twenty idle, ignorant, and uninformed, become, in a few years after, men of science and information? Why, then, should a woman of twenty, or of any age, think that because fhe is married, all improvement is impoffible? Impossible I grant it is, if she intends

to lead a life of modern distipation. If her mornings are to be spent in the street, and herevenings at the card-table, improvement is out of the question. But it is not to such mothers that I address myself. There are those of a different description; amiable, well-intentioned, domestic characters, who have an earnest wish to fulfil every duty, but who, from a fatal prejudice, do not consider an accession of knowledge as any of the duties belonging to the matron state. Let such seriously resent in what light they would wish to be viewed by their children, and as they would desire to be respected, let them pursue the course that can alone render them respectable.

Happy the woman, who, in her endeavours to improve and cultivate her understanding, finds an auxiliary in her husband! Happy she, who is thus encouraged to the delightful and important task! Her success is infallible, her reward is certain.

But if her husband be one of the multitude; if fate has bound her to a man who despites female intellect; whose idea of maand the friend; who merely wishes in his wife to find the qualities of the housekeeper, and the virtues of the spaniel; even then the wife is without excuse, who does not endeavour to qualify herfelf for fulfilling the duties of the mother. Let her confider, that in the respect and esteem of her children the will find a folace for the want of that purest species of happiness which slows may not be willing to allow her fuperiority of wisdom, (and if she be truly wife, she will never contend for it) but her children will rife and call her bleffed!

Let us now return to the confideration of that arrogant confidence in felf-opinion, which is fo frequently the refult of a child's finding itself in some instances wifer than its mother. This generally produces a degree of dogmatism very unfavourable to the improvement of judgment. " By what " means foever," fays the respectable Watts, " the dogmatist comes by his opi-" nions, whether by his fenses or his co yet he believes them all with the fame " affurance that he does a mathematical 66 belong to him; every thing with him is certain and infallible. Persons of this ce temper are feldom to be convinced of " any mistake; a full affurance of their " own notions makes all the difficulties on " their own fide vanish fo entirely, that " written as with fun-beams, and wonder es any one should find a difficulty in it."

The more the judgment is exercised in early life, the less liable will it be to this proud confidence in its own authority, which is never connected with true wisdom,

though it is a frequent attendant upon quick parts, fuperficially cultivated; as is likewife its opposite—Scepticism.

"The dogmatift is fure of every thing the fceptic believes nothing. Perhaps he has found himfelf often milaken in matters of which he thought himfelf well affured in his younger days, and therefore he is afraid to give affent to any thing again."

"Both these prejudices," continues our author, "though they are so opposite to "each other, yet they arise from the same "spring, and that is, impatience of study, and want of diligent attention in the search of truth. The dogmatist is in haste to believe something; he cannot keep himself long enough in suspense, till some bright and convincing evidence appears on one side; but throws himself casually into the sentiments of one party or anomether, and then he will hear no argument to the contrary. The sceptic will not "take"

take pains to fearch things to the bottom,

" but when he fees difficulties on both

" fides, refolves to believe neither of them."

It fometimes happens, that these dispositions are united. Who more dogmatical and peremptory than the sceptic in his system of unbelief?

Doctor Watts affures us, that "the "only cure for both these follies is humi"lity of foul, patience in study, diligence in "inquiry, with an honest zeal for truth."

What he mentions as a cure, I would recommend to parents to teach their children as a prevention. All the diforders of the mind are much more eafily prevented than remedied. Where pride and felf-will have been permitted to take deep root, it will be a difficult talk to inculcate true humility. Where the faculty of attention has never been sufficiently exercised, we cannot exped either patience in study, or diligence in enquiry. And where the mind has not been accustomed to find pleasure in the discovery

of truth, we need not expect that it will ever exert much zeal in its pursuit.

Another fource of error, concerning which it behoves us to be upon our guard, is that disposition to rest upon authority, which, if we do not take care to prevent it, may spring from that considence in our superior wisdom and knowledge, which it is essential that the pupil should possess.

It requires, I confers, great delicacy of conduct to imprefs the pupil with perfect confidence in our judgment, and at the fame time to lead him to exert his own, as if he had no fuch authority to rely upon. The only method by which it appears to me that this can possibly be effected, is early to lead the mind to those investigations, of which we certainly know the result. The child will then perceive the steps by which we were led to the knowledge we posses. He will perceive that our advantage over him is the effect of diligent enquiry and actual research, not of intuition.

We may then, without any apprehension knowledge upon important points, will be matics. But if, instead of being led to exercife his own judgment, he has been taught every thing as dogmas of our fuperior wifdom, he will acquiesce in our

This reliance upon authority is reprefented by fome writers as the very effence of female virtue.

[257]

"Gop is thy law—thou mine; to know no more,
"Is woman's happieft knowledge, and her praise."

So faid Milton: but fo faid not an higher authority than Milton, when in emphatic language he commended the "better part" taken by Mary, who, not contented with hearing the words of truth and wisdom at fecond hand, gave her whole foul to the trines it was her happiness to hear delivered. According to the common prejudices of fociety, the praife was Martha's due. Her attention was folely directed to the objects within her proper fphere. Enough for her discourse related by her brother, on whose for explanation of all that it was necessary for her to believe or practife. And fo certain was fhe of acting with propriety, that, confident of her own fuperior merit, upon what she thought the faulty conduct

0

of her fifter. The rebuke she received establishes it not only as a privilege, but as a duty, in the fex, to hear, to enquire, and to judge for themselves. The contrary is evidently Anti-Christian doctrine: and, like all others of the same stamp, is found by experience to be repugnant to the principles of common sense.

To the being who is taught to receive all opinions from authority, judgment is an ufelefs gift. In such beings, therefore, judgment will lie for ever dormant; and without judgment, how is she to choose the authorities that are to be her guide? If her early affociations of good and evil have been erroneous, they must remain erroneous for ever: for it is by these affociations that her choice of authorities will be directed. If the clearest, the most momentous truth be delivered from a quarter, against which she has been prejudiced, the truth is contemned as falshood. If the most flagrant and satal error has been

embraced by the authority she esteems, she receives it " as truth of holy writ"

were confined to the narrow circle of dothose affociations which made their resting upon authority innocent at least, if not housewife, an extraordinary needle-woman, and a careful mother, they attached ideas gical, their political, and even their moral or ghostly fathers, " nothing doubting;" and as their attention was folely occupied in the narrow sphere of their perceptive troubled themselves with much enquiry, If the higher powers of the mind were not faculties were so cultivated as to produce

that equality which is always favourable to the production of common fenfe; and in the early cultivation of these first faculties, a foundation was laid for the perfection of all the higher powers of the mind, whereever a superior degree of mental culture was bestowed. Of this we have a decisive proof in the many illustrious instances of semale learning and genius, which adorned the fixteenth and seventeenth centuries.

It was not by means of pretty florybooks, abridgments, and beauties of hiftory, nor yet by feraps of poetry feleded from the best authors, that a Lady Jane Gray, or a Lady Anne Askew, attained those high accomplishments, and that intellectual energy, which has rendered them the admiration of succeeding ages.

The early education of those celebrated examples of female wisdom and virtue was, probably, in many respects, the same as their contemporaries. Their perceptive faculties were cultivated in infancy by atten-

needle-work deserves a higher place in our vogue was well calculated to answer this grotefque figures which were then copied, faculties which do not unfold themselves ness of an after-period; whereas attention,

We view with contempt the talteless gold-coloured dog, which was, perhaps, were acquired, which were of no small use mechanically. These feldom fail to produce habits of mental inactivity. They may be employed as fedatives to ardent minds, but will always be found injurious to the slow and torpid.

Another important advantage, peculiar to the high-born females of former times, was derived from those affociations of which I have already taken notice. Ideas of glory were not then attached to every species of singularity that can be atchieved by impudence or folly. They were connected with self-approbation, and the esteem of the worthy and the wise. An attention to domestic duties was then deemed honourable, an affociation which no attainment in the walks of literature could dissolve; it maintained its ascendancy in the minds of the learned, and was a lamp to the path of the illiterate.

Another great advantage these ladies enjoyed, in the very limited number of books they had it in their power to read. This circumstance produced such frequent and attentive perusal of the few good authors they possessed, that they became mistresses of every subject on which they treated. Instead of confused and impersed notions of the author's meaning, their conceptions were clear and accurate; and where there are clear and accurate conceptions, the judgment will be found and vigorous.

In the acquirement of the learned languages these ladies had many advantages; the very process gone through in attaining them is favourable to arrangement of ideas, and highly inftrumental in giving that clear conception of the meaning of words, which is so effectial to every species of intellectual improvement. By their intimate acquaintance with the poets, the philosophers, and the orators of antiquity, we find the use they made of the key of those treasures of ancient learning, to which the moderns have been so much indebted for their most brilliant thoughts. But

while possessed of all this knowledge, we find that the study of the important doctrines and precepts of Christianity occupied the first place in their attention. The human mind had then been but lately emancipated from those chains by which the Romish church had so long held her votaries in subjection: upon the points in dispute it was then the fashion to exercise the judgment; and the many great and vigorous minds which were then produced, plainly shew that the judgment is never exercised in vain.

A minute investigation into the manner in which these ladies performed the relative and domestic duties of life, would serve to convince us, that it is not by a careful cultivation of all the faculties, by extensive knowledge, or classical learning, that women are in danger of being led from the duties of their proper sphere. No. It is from the filly vanity which is a consequence of the partial cultivation of the intellectual

powers

[266]

powers, from false affociations, which annex ideas of importance to what is trifling and infignificant, and which connect ideas of glory with the filly admiration of fools and coxcombs—that the mind is effectually perverted. And whence are these false affociations derived? By feriously reflecting on the tenor of the ideas which modern education is calculated to produce, the question may be easily resolved!

Adieu

LETTER IX.

JUDGMENT

Farther Illustrations on the Method of cultivating this Faculty.—Education of the Lower Orders.—Religious Instruction of the Poor, and of the Rich,

S O much, my dear Friend, remains to be faid upon the cultivation of judgment, that I must beg leave to give you one other letter upon a subject which is deserving of as many volumes.

We have already seen that the faculties of conception and judgment are coeval; that without vigour and accuracy in the former, the latter must ever remain imperfect; and that where the latter is uncultivated, the former will be in a great measure useless. Tell a child 'that he who 'runs swiftest will soonest reach the goal;' to understand this, the child must have a diffing

diffinct conception of running; he must also have been able to make comparisons between different degrees of swiftness, and to conceive a lesser and greater degree of it, before he can acquiesce in your conclusion; which acquiescence is the work of judgment. If any of the former ideas are indistinct, the judgment will rest upon your authority; the child may learn to repeat it as a judgment of his own, but it is in reality not his, but yours: whereas, if he has accurate and distinct conceptions on the first part of the proposition, the judgment included in the second is inevitable, and may be termed intuitive.

Where children are taught every thing by leffons, where their perceptive powers are never exercifed, and their conceptions never cultivated, all their judgments are received from authority. People who are thus educated, are accordingly as little in the habit of forming opinions for themfelves, as of fabricating the clothes they wear. And as without the affillance of the mechanic, the artifan, and the drefs-maker, they must, of necessity, go unclothed; so without the affistance of public opinion, would their minds be naked, and destitute of principle or sentiment.

It is upon the prefervation of a just balance betwirt the faculties of conception and judgment, that the foundness of the intellect principally depends. This equality in the cultivation of their mental powers compensates, in a great measure, to the vulgar for the want of that education to which neither their avocations nor circumstances will permit them to aspire. With them attention is confined to a narrow sphere. Their perceptive powers are cultivated but to a certain extent; and this cultivation is entirely under the direction of the imperious mistress, necessary.

The conceptions are exercised in the same manner upon few objects; but where the attention is fully given to these, they are, as far as they extend, perfect and diftinct. So it is with the judgment: its fphere of operation is narrow; but while it moves in that fphere, it is never erroneous. Hence we find much good fense in the observations of the peasantry, while these observations are confined to subjects upon which they have had access to such information, as could give them clear and diffinct ideas.

If the above observations are well sounded, it follows, that if the education we bestow upon the labouring classes, be of a nature calculated to derange the just proportion of the faculties; to give a partial cultivation to those which are never to be called forth by the business, or the duties, which the individual is destined to sulfil, while those which are in daily and hourly requisition are utterly neglected; we in reality do more harm than good.

Am I, then, of the number of those who deem the bleffing of education improper

for the vulgar? Am I one of those children of pride, who wish to see the darkness of ignorance bespread the regions of poverty, while I sit with my compeers elate in Goshen, and enjoy the light? Heaven forbid!

I honour and applaud the noble efforts that have been made, and that are still making, by many generous minds, to give instruction to the children of the poor. Far from wishing to restrain the zeal of charity, I would do all in my power to

flow from religious principle, as hope, confidence, love, reverence, gratitude, and joy, are all not only favourable to happiness, but so effential to it, that I do not semple to affirm that where they are wanting, happiness will never be found.

If these observations upon the nature of happiness appear just, we ought, in our endeavours to promote the happiness and well-being of the lower classes, to keep them in view; if we accept of them as principles, we shall be at no loss how to proceed.

I have already endeavoured to fliew the early progress of the passions. In this respect the children of the poor and of the rich are pretty much upon a level; they are in truth equally neglected. In early life the children of the villager are as much ruined by foolish indulgence as the children of his lord. The affociations which beget a tendency to the fellish and malevolent passions, are with equal facility acquired by both, and are effectually counterasted in

neither. The first step, therefore, towards the education of the lower orders is, to instruct the parents in the duties they owe to their children in early life. Books to this effect ought to be distributed; exhortations to be frequently given by the clergy; and rewards bestowed, by the contributors to schools, to those parents whose children appear to have reaped most benefit from home instruction and example.

To undertake the education of a poor man's family is, no doubt, a very good and charitable action; but to put the poor man in a way of educating his family himfelf, is doing infinitely more fervice to fociety. (E)

The education of the heart is the work of domestic life, and where this preliminary is neglected, all the endeavours of the schoolmaster will be fruitless. In the religious education of the lower orders, there is feldom, I fear, any appeal made to the heart and the affections. The religion of the VOL. II.

vulgar

vulgar is therefore, in general, gloomy, fuperflitious, and I had almost said, ferocious. While all the other intellectual faculties are permitted to remain dormant for want of cultivation, the imagination is roused and filled with the darkest images. The tendency of this temper is to produce distrust, suspicion, envy, and malevolence; and when spiritual pride is added, it brings forth arrogance and presumption. This is not the religion of Jesus Christ. Far other are its fruits; widely opposite is its tendency upon the heart!

The first view to be given of the Delty to the poor, as well as to the rich, is as the Giver of all Good. The universality of his providence and of his protesting care ought to be carefully instilled. By representing the Supreme to children as a malignant spy and an avenging tyrant, no affections consonant to the spirit of the Gospel can possibly be produced.

Another

Another error in the religious instruction of the poor is addressing ourselves to the judgment, where the conceptions have never been so far opened as to be adequate to the comprehension of the simplest proposition, upon any subject that is not an object of perception. By doing fo, we may give religious bigotry, but we shall never impart religious knowledge. The conceptions of the vulgar, or of the highborn, will be clear and accurate, exactly in proportion to the pains which have been bestowed on their cultivation. By one medium only can they, in either case, be cultivated; and this is, by attention to the objects of perception.

Where the parents are foolish, idle, or profligate, the faculty of attention will never be called forth, or never at least exercised on proper objects. To rescue the children of such parents from the dominion of ignorance and vice, is truly laudable. But where such beings are the objects

objects of our charity, it ought to be our primary endeavour to make up to them for the neglect they have experienced; which must inevitably have rendered those faculties defective, upon which every species of intellectual improvement ultimately depends.

If we proceed upon other principles, and, without bestowing any pains in cultivating the perceptions, the attention, and the conceptions, vainly imagine that by teaching these poor children to repeat words, we shall strengthen the judgment and improve the heart, we cannot fail to meet with disappointment. In the process of learning to read, the three first faculties are no doubt exercised; but if this is the only exercise that is given to them, they will reap but little advantage from it: much more would they derive from being made acquainted with the nature and use of all the objects within the fphere of their obfervation. The simple mechanism employed

in the manufactures with which they are most familiar, ought to be explained to them in terms level to their capacity. The attention ought to be turned to the minute examination of every object with which they are conversant. The leather binding of their books, the paper which forms the leaves, the thread on which these leaves are strung, and the characters that are printed on them, may be made instrumental in invigorating the conceptions: and I am persuaded, that habits of attention thus acquired would be found of greater use in developing the faculties, than any leffons which the poor ignorant children could be made to read, or get by heart. They ought foon to be made fensible, that all the comforts of human life are the effects of industry, that every article of food or clothing is the product of the labour of many individuals. The co-operation of Divine Providence, without which the labour of man would in many cases be obvioufly

viously ineffectual, ought to be displayed in the clearest light; to this end such examinations as the following, would be highly falutary:—

"What are you going to eat for your breakfass?" 'Bread.' "Who gives you this bread? Your father; but how does your father come by the money which buys it?" 'He earns it by labour.' "But if he were sick, could he thus earn it? By whom is his health preserved? Who makes the bread? "What is it made from? Can the farmer cause the wheat to grow? Were the farmer to be idle, and not to sow his land, would God Almighty exert his power to raise him a crop? You then see that the bread you eat, is the blessing of Providence upon industry."

We have already feen that clear and diffinct conceptions are necessary towards even the lowest degree of judgment; but there may be conceptions without judg.

ment, as there are conceptions without belief. I may conceive the figure of a horfe with wings, though I do not believe that fuch a creature ever existed. These are not the conceptions on which the minds of children ought to be exercised. They ought to be made to form clear conceptions on the objects of sense; and on these, also, ought the judgment to be exercised, before it is made to pronounce on the truth or fallshood of propositions that are abstract, and on which their minds must consequently be destitute of all ideas of comparison.

Habits of attention to the objects of perception are fo effentially necessary to those who by their fituation are destined to be constantly employed upon sensible objects, that we may affure ourselves, when by the education we give to the poor, we incapacitate them for this attention, we do an injury, where we intended to confer a favour.

This point deferves attentive confideration. I could adduce many proofs in fupport of my opinion concerning it; and make no doubt that many ladies, as well as myfelf, have experienced difappointment, in the hopes they had formed of making excellent fervants by means of an education above the vulgar.

After having infpired a tafte for reading and excited the powers of the imagination, while attention to the cultivation of the objects of perception has been totally omitted, we are furprized to find that the proper business of the servant is neglected. After the most careful cultivation of the reasoning faculties, we are vexed by instances of deficiency in common judgment; and after the most services pains to impress religious truths and moral fentiments upon the mind, by means of lessons and lectures, we are sometimes pained by discovering proofs of irreligion and immorality.

The cause of this disappointment we may, in many inflances, trace to that partial cultivation of the faculties, which, while it ripened those least useful to the possessor, left the first and most essential powers of the mind in a manner dormant. Happier confequences would, I am perfuaded, enfue, if, in the education of perfons to whom habits of active industry are effential, we made it our endeavour to guard against affording fimuli to the imagination. Instead of doing fo, we ought to improve the powers of perception; to rouse attention; to lead the mind to form clear conceptions upon the common objects and common affairs of life; and upon thefe also to exercise the judgment. It is thus only that we can hope to produce that common fense, which is sterling in every region; the current coin that is equally ufeful to the high and to the low, to the learned and to the unlearned. It is ever in requifition, ever neceffary; nor can all

the stores of wit and knowledge compenfate for its absence. As it is in a peculiar manner essential to those who are employed in conducting the common concerns of life, the education by which it can be most esfectually cultivated, is surely the best which can be given to such as are doomed to move in a narrow sphere; and where the education we bestow has not this tendency, it cannot fail to be injurious.

By teaching the poor to read, we put into their hands the most powerful instrument of improvement to all the intellectual faculties; but if these faculties have received no previous culture, we need not expect that they will ever learn to employ this power to any useful purpose. The question put by the Apostle to the Ethiopian, "Understandest thou what thou readest?" if put to the children of our charities, might well be answered by them in the words of Candace's prime minister, "How can I, except some man should guide

"guide me?" Is it by teaching children to repeat strings of judgments upon abstract propositions, which they have no faculties to apprehend, that we expect to give them that understanding of the Scriptures which shall make them wise unto salvation? These judgments may be repeated as distinctly as possible, but it is impossible they should be believed; because where there is no conception, there can be no belief.* The conceptions must be cultivated, in order to render religious instruction (what by proper care it will not fail to be) the

[•] No candid reader will fo far pervert the fenfe of this expression, as to accuse me of maintaining the necessity of full and adequate conceptions upon every subject of belief; as this, from the limited range of human knowledge, is in many instances impossible. But even upon those subjects where our conceptions are most inadequate, as the Supreme Being, Providence, Eternity, &c. we are so far from being destitute of all conception, that the ideas assisted to these terms are objects of restection to the mind. It is far otherwise with regard to propositions that are inevery respects beyond the comprehension.

means of improving the judgment, elevating the fentiments, and purifying the heart,

In the infancy of the human race, the ALMIGHTY PARENT vouchfafed to be the infanctor of mankind. Of what nature were the revelations of the Divine will which were made to the first ages? Were they upon abstruse points of doctrine? No: the wisdom, power, and goodness of God, manifested throughout the works of creation, afforded an everlasting theme to the inspired writers of the Old Testament.

The poetry of the Hebrews is a continual hymn of praise to the Great Creator. The Supreme Being is there represented as the animating soul of nature. All his works praise Him; sun, moon, and stars, shew forth his glory. His superintending Providence is traced throughout all events from generation to generation; and his superintending care is represented as extending to the wild beasts of the forest, and to the fowls of the heavens!

At most schools for the poor, the children are taught to read in the Old Testament. But are they taught there to read the important leffons I have above described? Alas! no. Their conceptions are never fo far opened as to permit these descriptions to excite any emotions in the heart. These emotions are the less likely to be excited, from not being in unifon with the only conceptions of the DEITY which have been obtained. These have been awful and terrific, little calculated to excite the feelings of admiration and gratitude; nor does the way in which they read the Bible tend to give any ideas upon the subject to the mind.

I once paid a vifit to a country school, where the children were taught, as usual, to read in the Bible. The mistress, good woman! piqued herself upon the knowledge of the stops, which, as she very justly beferved, werein general too little attended to at schools of the same description. To

thew

shew the proficiency of her scholars, one of the best readers was called up. The poor child, taking in its breath, and exalting its voice to the highest pitch, began to scream out some verses in Exodus, repeating every stop aloud with great emphasis, till happily it concluded with a twang at per-i-o-d. I at that time laughed heartily at the ridiculous exhibition, but have since viewed this abuse of the facred writings in a more ferious light.

As we do not profess to have one religion for the poor, and another for the rich, whatever upon this subject applies to one class applies to all. It was the emphatic description given by our Saviour to prove his divine mission, that to the poor the Gospel was preached; and by the poor it was ordained, in the wisdom of Providence, that the glad tidings of falvation should be first dispensed throughout the world.

Before our religion the diffinctions formed by human pride vanish; in its presence worldly

worldly pomp and worldly honours are annihilated. Stript of his adventitious greatness, Man appears as he is; whatever be his flation, the frail child of dust!—however humble his lot, the heir of immortality!

While all those ideas of equality, which philosophical or interested specularists have endeavoured to establish, tend to inspire hatred, envy, pride, and discontent; the equality taught by the Gospel inspires the purest benevolence. It teaches humility to the rich, and contentment to the poor; and fraternises (if I may so express myself) the human race.

The opinions I have advanced upon the cultivation of the faculties, receive no flight fupport from the confideration, that the knowledge of the Scriptures, I mean a true practical knowledge of them, requires not those higher powers of the mind, which must be brought to some degree of perfection before a knowledge of the abstract sciences can be attained. The conception

must, indeed, have been so far exercised, Old Testament, assistance is given to the mind in forming them, by a perpetual reference to the objects of perception. If the Bible however, be read merely as an exercise in the art of reading, no ideas are to be expected from it. But if it be referred to, as the repository of all useful knowledge; if it be made use of to awaken the of the heart, it will be rendered an effectual mean of improving the conceptions, and enlightening the judgment. The hiftory of the creation, and of all the events antecedent to the dispensation of the Mofaic law, are recorded in terms of fuch beaumake a strong impression upon the minds of children. To make this impression useful, it is not sufficient that the facts are known, nor that the firmest belief in the

reality be established in the mind. It is the providence of God which animates the scene. Confidence or faith in this Providence is reprefented as forming the virtue of the Patriarchs; it is this by which they are diflinguished from the favages of other ages, and of other nations. The knowledge of the true God was the inheritance of the Hebrews; it breathes in every line of their facred writings; elevating the conceptions to a pitch of fublimity beyond what mere learning or genius has ever yet attained. The idea of the Supreme, as the Father and Preferver, not only of the human race, but of the brute creation, is mingled with devotional fentiment; and ought particularly to be dwelt upon to those, who, from their situation in life, have it in their power to exercise humanity, or the contrary, upon the inferior animals. The cruelty that we fee daily exercifed upon brutes is shocking to every feeling heart; and

and were leffons upon this subject enforced, as they may be, by the authority of Scripture, to be given at our charity-schools, it would be of service to humanity.

When the affections have been thus awakened, and the powers of conception and judgment in some degree opened, the history of the Jewish nation will not only gratify curiofity, but excite furprize, wonder, and, it may be, some degree of indignation and discontent. Why was this people, weak and wicked as they are by their own prophet described to be, the chofen people of Gon? Children, who by a more liberal education have had the fphere of their knowledge enlarged, are still more apt to indulge in these anxious doubts, which, if filenced by the voice of authority, may end in total feepticifm. The vulgar, taking every thing literally, are apt to fall into an error no less fatal; and to conceive, that vices which were committed by the people of God, cannot be confidered as unpardonable offences.

It is, therefore, of great importance, to make it plain to young people, as foon as we perceive these doubts to have a place in their minds, that the descendants of Abraham were not chosen by God, to set forth to the world an example of pure and heroic virtue. They were feparated from the rest of mankind by peculiar laws and ceremonies, in order to preferve the knowledge of the one only and true GoD; and divided into tribes, who each preferved an accurate account of its genealogy from him in whom it was promifed "that in his 66 feed should all the nations of the earth be "bleffed," in order to prove the accomplishment of that promife in the birth of the Melliah. The immoral conduct of the people thus highly favoured with fuperior necessity of a revelation yet more perfect To faith in the directing and protecting providence of God, was to be added a faith still more powerful and efficacious.

Thus may children be led by degrees to a knowledge of the New Testament dispensation.

While the feriptures are thus opened to them, they will, like the disciples on their journey to Emmans, find their hearts burn within them. The history of their Redeemer's life and fufferings, of his meritorious death, and glorious ascension, will awaken each amiable affection, each interesting feeling of the heart. They will see, that as protecting Providence was the boon promifed to the believers in the first revelation, Divine Grace is the peculiar promife of the fecond. They will perceive, that by iniquity and impenitence both may be forfeited; and thus the necessity of a strict adherence to the moral duties will be made clear and evident, and piety and morality be fo strongly affociated in their minds, as to prevent a tendency to supersition on the one hand, and to enthuliasm on the other. For this profitable knowledge of

the scriptures, neither genius, nor learning, nor abstract reasoning, are necessary. The deductions from the first principle of a Supreme Being, eternal, wife, and good, are a scries of self-evident propositions, which require only a moderate power of conception and strength of judgment to comprehend. Cultivated imagination is here of no use; and in reading the scriptures, sincerity and simplicity of heart are more effential requisites than all the critic's lore.

Among those who have studied the seriptures as critics, and who, in reading the sacred writings, have entirely applied themselves to the discovery of recondite knowledge, endeavouring to each obscure passage to find a support to some previously adopted system. I have sound many who are declared enemies to affording scriptural instruction to the poor; many who think that the Bible ought by no means to be put into the hands of youth: but never did I meet with one who had been taught

to apply its precepts and its doctrines to the heart, that harboured any apprehenfion of the confequences of giving feripulral knowledge to the otherwise illiterate. It is this application of the facred writings which it ought to be the inftructor's aim to teach. If, instead of this falutary application of the Divine commandments, we go about to establish our own righteoufnefs, by interpreting the judgments denounced against fin in the condemnation of those who differ from us in opinion, we shall, indeed, reap little advantage from scripture knowledge. Comments of this nature are, I am afraid, but too common: and as they are the natural result of a partial application of particular paffages, they can only be prevented, by leading the mind to feek for the general meaning in the general spirit of the Gospel writers; which, if done with fincerity, will always bring fome falutary truth home to the bosom. Striking are the leffons that are

given upon this head by our bleffed LORD. Let us labour to impress them in such a manner as to render the reading of the scriptures "profitable for doctrine, for reproof, for correction, for instruction in righteousness."

It is in order to effect this application of the doctrines and precepts of the Gospel to the heart, that I would gradually prepare the heart for their reception. I have, as I am informed, given umbrage to fome pious minds by what I advanced upon this subject in the former volume. This information has induced me scrupulously to reexamine all the arguments upon which my opinion was formed; with a firm refolution of freely acknowledging error, whereever I found it. No arguments, indeed, were offered by those who differed from me, to affift me in this refearch. By thefe I might, perhaps, have been more effectually enlightened; but I confess, that after having given all the attention to the fubjectof which I am capable, I still remain of opinion, that where there are no conceptions, there can be no belief; and that to force articles of belief upon the mind, before the conceptions have been so far opened as to afford the possible exercise of judgment, (the faculty by which we alone determine on the truth or falshood of propositions) can have no other consequence, than to produce either a blind and bigoted adherence to unexamined principles, a total indifference to all principle, or the extremes of seepticism and insidelity.

Greatly have they mistaken me, who imagine that it is from a light estimation of the peculiar doctrines of Christianity, that I am led to disapprove of the means which are some times taken to ensorce them upon the infant mind. It is my respect for these doctrines, my opinion of their importance, and my conviction of their being sound consonant to truth and reason, which leads the to recommend with earnessness, that

they may be fo enforced as that the heart and the understanding may be equally impressed with their truth. In this all ranks of fociety are alike concerned; and it is therefore my opinion, that the religious education of the poor and of the rich ought to be conducted upon the fame principles. By cultivating the affections of the infant heart, and inspiring towards the great Creator feelings of gratitude, reverence, hope, confidence, and love, the conceptions will be opened towards the perception of moral truth; the judgment will thus be exercised, and when it is fufficiently matured to perceive the importance of the doctrines of the Gospel, then, and then only, will they be received and cherished so as to yield the fruits of faith and righteoufness.

The period when this degree of maturity takes place, it must be left to the preceptor to determine. I should, however, by all means recommend, that the fundamental principles of religion and morality

be deeply impressed upon the mind before imagination begins to predominate.

When the judgment has been previously strengthened by religious principle, imagination will ever afterwards submit to the control of reason; but if we permit imagination to take the lead, the religious principles and opinions of our pupils will as may have very fatal confequences. Superfition and enthufiasm are the Scylla and Charibdis of found and rational piety. In order to avoid the former, care must be taken to watch over those early affociations which connect ideas of good and evil with circumstances which are trivial or indifferent; and to preferve from the latter, Imagination must be put under the regulation of Judgment. Adieu.

LETTER X.

Lesson in Tiere

Imagination defined.—Necessity of its Operations being guided by Judgment.—Illustrations.—Definition of Taste.—Mistakes concerning the Cultivation of this Faculty. Union of Conception and Judgment essential to its Cultivation.—Illustrations.

MY DEAR FRIEND,

THE necessity I feel myself under of compressing into the limits of a single Letter the observations that occur to me on the subjects of Imagination and Taste, will compel me to be concise; I shall, however, endeavour to be as little obscure as possible.

The word Imagination has great latitude in its application. It is fometimes employed to denote fimple apprehension; it being very usual in common conversation to say, that we cannot imagine how such a thing could happen, when we mean, that we cannot conceive it. In this sense, you will observe, that I have carefully avoided employing it. It is sometimes likewise applied in a general way, to express the operation of the mind in thinking; and in this incorrect way of speaking, we frequently observe, that a thing occupies the imagination, when in reality it is the subject of restection.

Again; the term Imagination is fometimes made use of in describing the intellectual pleasures and pursuits, in contradistinction to those of sense. In this way it is applied by Doctor Akenside, whose poem on the Pleasures of the Imagination describes the employment of all the intellectual faculties.

By Imagination, in the fense to which I have confined myself, is understood that power of the mind, which is exerted in

forming new combinations of ideas. The power of calling up at pleafure any particular class of ideas is properly denominated Fancy. A creative imagination implies not only the power of fancy, but judgment, abilitraction, and talte. Where these are wanting, the slights of imagination are little better than the ravings of a lunatic.

From the nature of this faculty, it is obvious, that it can be exercifed but in a very flight degree in childhood, the ideas being at that period too few in number to afford materials for new combinations; or should the attempt at forming them be made, they must, from the want of taste and judgment, be weak and imperfect. But long before the mind can combine for itself, the conceptions are sufficiently vigorous to enter with avidity into the combinations made by others. If these are so artfully contrived as to interest the passions, or to excite the emotions of terror, hope, indignation, or sympathy, they become the

most pleasing exercises of the juvenile mind; but if this exercise be frequently repeated, it will infallibly produce trains of thought highly unfavourable to the cultivation of those important faculties, without whose aid the creative power of imagination can never be exerted to any useful purpose.

While the mind is occupied in making observations on the nature and properties of the objects of sense, its train of thought is merely a series of simple conceptions; but these conceptions are the materials with which imagination is at a proper time to work. On these conceptions, too, does judgment begin its operations; by these, is it exercised into strength; and by such exercise alone it is, that it can ever attain perfection. These operations are, as I suspected, greatly retarded, and in some instances utterly prevented, by a premature disposition to make attempts at combination; the inevitable consequence of having

the mind powerfully impressed by interesting fictions. After every fuch impression the train of thought flows for a confiderable time in the fame channel with the emotion that has been excited; and before judgment has attained the capability of directing its combinations, the images that are formed must of necessity be wild and incoherent. However incoherent they may be, they have fuch a tendency to inerease the flow of ideas, and, of consequence, to augment vivacity, that fuch children appear to much greater advantage, than those whose faculties are cultivated in the natural order. But when both arrive at maturity, they who have laid in the greatest fund of clear, distinct, and accurate ideas, must possess a manifest advantage.

Were imagination (as is unfortunately too often supposed) a simple faculty, which could be exercised to advantage without the affistance of the other faculties, the methods usually taken to cultivate it would

be judicious and effectual. But if it be in fact a compound of feveral other faculties, it necessarily follows, that its excellence depends on the degree of perfection, to which the faculties connected with it have arrived. The Iliad of Homer is a work of imagination; it exhibits a series of combinations, perhaps more assonishing in their variety, harmony, and consistency, than any that human genius has ever produced; but does it not in every line give a proof of clear and vigorous conceptions, of strong judgment, and profound resection? When our own Shakespeare, whose elevated genius

" Exhaufted worlds, and then imagin'd new,"

pourtrayed the character of Caliban, (who is certainly a creature of the poet's imagination) did not judgment evidently guide the pencil, and lay on the colours? From the incomparable productions of these extraordinary men, we may justly infer-

that all the faculties of the mind were by them possessed in an uncommon degree of vigour, and therefore conclude them to have been cultivated according to the order assigned by nature.

In a living author, whose remote fituation will apologize for a comparison which would otherwife feem invidious, we fee a ftill further proof of our argument. In the power of imagination, (taken according to its fimple definition) it is probable, that Kotzebue does not yield to either of the poets above-mentioned. But what are the combinations which his genius has produced? I have no intention of turning critic, and therefore shall decline answering the question; but think it not out of my province to observe, that if a deficiency in the powers of accurate conception and found judgment are laid to his charge, he has given us a clue to lead to the cause of this deficiency in his memoirs, where he defcribes his mother having, while he was yet a child, affiduously cultivated his imagination by the powerful emotions excited by romantic fiction. He tells us, "she "was a woman of sensibility, and de lighted in inspiring him with a taste for works of imagination, of which he soon grew enthusiastically fond." Of old Mrs. Shakespeare we know nothing; but from the sound judgment exhibited in the works of her son, I think the probability is, that instead of being a woman of semibility, (in the sense known of plain good sense.

To produce a work of genius, the power of imagination must be possessed in a very eminent degree; but unless a certain portion of the same imagination be possessed by the reader, the works of genius will never be perused with delight. Nothing can be re-lished but in proportion as it is understood; and thoroughly to understand an author, we must be able, with the rapidity of thought, to enter into all his associations. This can

never be done by those who possess a very limited flock of ideas. The heautiful allufions which at once illustrate and adorn the works of the learned, are loft upon those who are unacquainted with classical literature; and we may be affured, that many of the beauties of the ancient orators and poets are in like manner loft upon the learned of our days, from their ignorance of the affociations which produced them. A fmall number of ideas will, indeed, fuffice to pursue a simple narrative; and accordingly we find that narrative, either of real or fictitious events, is the only fort of reading which is relished by the uncultivated mind. Do we wish to inspire a taste for fludies of a higher order? Then let us lay a folid foundation for fuch a taste in the cultivation of all those faculties which are necessary to the proper exercise of imagination. Let us by the exercise of the reasoning powers, as well as of the conception and the judgment, produce

that arrangement in the ideas, which is alike favourable to invention and to action. In such minds the trains of affociated ideas are, if I may fo express myself, harmonized by truth. The ideas being numerous, diftinet, and just, are called up in proper order; and as arrangement in our affociations is the true key of memory, every idea that is wanted obeys the call of will. It is then that the power of imagination comes forth to irradiate the mind, and to give a new zest to the charm of existence. The combinations which it then prefents, arranged by judgment, felected by tafte, and elevated by the sublime ideas of Divine perfection, give an exercise to all the intellectual powers.

"What employment can he have wor"thy of a man, whose imagination is oc"cupied only about things low and base,
"and grovels in a narrow field of meau,
"unanimating, and uninteresting objects?"
and such must ever be the case with him
whose ideas are few, confused, and inaccu-

rate; and who, while incapable of expanding his mind to embrace the forms of general and abstract truth, has habitually employed his imagination on the chimeras of untutored fancy; fuch a person must be " insen-" fible to those finer and more delicate fenti-66 ments, and blind to those more enlarged " and nobler views, which elevate the foul, " and make it conscious of its dignity. " How different from him, whose imagice nation, like an eagle in her flight, takes a wide prospect, and observes whatever " it presents, that is new or beautiful, grand " or important; whose rapid wing varies " the scene every moment, carrying him "thro' the fairy regions of wit or fancy, " fometimes through the more regular and " fober walks of fcience and philosophy. "The various objects which he furveys, " according to their different degrees of 66 beauty and dignity, raife in him the lively 66 and agreeable emotions of tafte. Illus-" trious human characters as they pass in er review,

"review, clothed with their moral qualities, touch his heart still more deeply.
They not only awaken the sense of
beauty, but excite the sense of probation, and kindle the glow of virtue.
While he views what is truly great and
glorious in human conduct, his soul
catches the divine flame, and burns with
defire to emulate what it admires."

The reveries of fuch a mind are not only delightfully amufing, but falutary and ufeful. On the gay pictures delineated by fancy, judgment, reason, and the moral sense, exert their powers of criticism; and thus the casual combinations of imagination are made a means of improvement to the heart.

I have known a young person, prone to indulge in the reveries presented by a rich and lively imagination, who acknowledged that it was by reflecting on these spontaneous essuable of fancy, that she became

acquainted with the propenlities and imperfections of her own temper and disposition. In her dreams of future felicity, she found that the gratification of vanity was always included, or indeed formed the ground-work of the piece; the accordingly fet herfelf to root out a propenfity which she thus difcovered to be predominant. When mortified by the pride of others, she found fancy immediately busied in forming scenes whereon she was to act the superior part, and to retort the mortification on those by whom her feelings had been wounded. Conscience took the alarm, and taught her to apply to the Throne of Grace for the Christian spirit of true humility. Thus was imagination rendered subservient to religion, judgment, and reafon; and while it acts under fuch control, we may fafely pronounce it the first of human bleffings!

Where the imagination has been injudicionfly stimulated at an early period, it has little chance of ever coming under this

fpecies

[312]

species of regulation. The attention has ving been habitually engaged in purfuing the dreams of fiction, lofes a thousand opportunities of information and improvement, and the number of ideas must confequently be extremely circumfcribed. The judgment having never been exercised on realities, can only compare ideas that are ever liable to error. An expectation that rhe fame causes should always produce fimilar effects, will, to the mind which has been exercifed in fiction, be attended with the most fatal confequences; the real events of life fucceeding each other in a very different train from that in which they are represented in such productions. The false affociations that are thus produced in the mind, may not only millead the judgment, but, as I have endeavoured elsewhere to thew, may effectually pervert the heartthe fenfibility excited by fictitious reprefentations of human mifery being very

far from that genuine spirit of benevolence, that is actively exerted in alleviating the diffresses which it cannot remove. Where the judgment has been strengthened by observation, and habits of active benevolence have been, in fome measure, acquired, and confirmed by religious principle; then, indeed, the luxurious tear, called forth by the witching power of imagination, may be indulged with fafety; for its fource will not then be mistaken. But where by imagination fenfibility has been brought into existence, to the woes of imagination will fenfibility be confined; and far too fickly will be its constitution, to produce the active charities of life.

TASTE is fo intimately connected with imagination, that many of the observations applicable to the one will be found to reach the other. The emotion of taste, though simple in its operation, is derived from complex sources. Its very existence depends on the vigour of conception, and implies

implies the exercise of judgment. Nor are these faculties alone equal to the production of this delightful emotion; as we may be convinced, by observing the numbers of persons who possess these faculties in an eminent degree, who, nevertheles, are incapable of experiencing the emotions of taste. Without a certain portion of sensibility, I believe, true taste is never found. How much this sensibility depends upon organization, I cannot presume to determine; but that it is seldom the boom of uncultivated minds, experience affords us convincing proofs.

To perceive and to enjoy whatever is beautiful or sublime in the work of nature or of art, is the peculiar privilege of taste. Its emotions are accordingly divided by an author,* to whose elegant and judicious remarks I confess many obligations, into the emotions of fublimity, and the emotions of beauty."

"The qualities that produce these emotions, are to be found in almost every
class of the objects of human knowledge,
and the emotions themselves afford one
of the most extensive sources of human
delight. They occur to us amid every
variety of external scenery, and among
manydiversities of disposition and affection
in the mind of man. The most pleasing
arts of human invention are altogether
directed to their pursuit; and even the
necessary arts are exalted into dignity by
the genius that can unite beauty with use."

That a fusceptibility to the emotion of rafte does not altogether depend upon the original frame of our nature, is evident from its being entirely confined to minds possessing a certain degree of cultivation; whereas the emotions of surprise, joy, wonder, &c. are felt by all. Nor is the mind of the most cultivated at all times equally susceptible of these emotions. All must know, that there are moments when objects

objects of fublimity or beauty make no impression. All must have experienced, that scenes which have at one period called forth the most vivid fensations of delight, have at another been viewed with the most perfect indifference.

The more deeply we examine this curious fubject, the more fully shall we be convinced, that the emotions of taste entirely depend on the train of ideas which are called up in the mind by certain objects of perception. If the mind has not been previously furnished with a store of ideas that can be thus associated, the finest objects of sublimity or beauty will never give a pleasurable sensation to the breast. They may be viewed with wonder, with admiration, but will never produce emotions of sublimity or beauty.

The above observations may be further illustrated, by reflecting on the manner in which a taste for the beauties of nature in the material world, and for the beauties

of poetry, enhance each other. A young mind, accultomed to the contemplation of rural feenery, is enraptured by the poetical descriptions which present a transcript of all that had so often charmed the imagination.

"When Nature charms, for life itself is new."

The elevated fentiments and fublime ideas of the poet give, on the other hand, a number of new affociations, which are henceforth called up by the fcenes of nature, and become to the mind of fentibility a new and inexhaultible fource of delight.

By the ideas affociated with them, a thousand founds that are in themselves indifferent, nay, some that are rather in their natures disagreeable, become pregnant with delight. I have for this last half hour been leaning on my elbow, listening to the distant tinkling of the sheep-bell, a found so perfectly in unison with the surrounding scenery, as to appear enchantingly beautiful. Upon reslection, I believe it to be just fuch a bell as is tied to the pie-man's

basket, which I have often in town deemed an execrable nuisance. The different emotious which it now excites can only be resolved into the different trains of ideas with which the found is affociated.*

My narrow limits will not permit me to go into this subject at sufficient length; but the hints I have suggested, will, if pursued with any attention, infallibly lead us to conclude, that the foundation of the emotions of taste, with regard to natural objects and to poetical description, must be laid in distinct

I once knew a lady who had been brought up in one of the most confined streets in the city of London, where her father had, by dint of industry, accumulated a large fortune. When complaining of her hard sate, in being obliged upon her marriage to leave the metropolis for the dull sameness of a country life, the drew a striking picture of the joys she had unwillingly relinquished. "There (she faid) she never knew what "it was to be lonely; for besides the buftle all day long in the street of carts and coaches, there were forty "coapers in the back-yard, who were knock, knock-"ing, from morning till night!" Does not this strongly evince the power of affociation in forming our ideas of harmony?

and accurate conceptions. By these must the ideas be accumulated, which, by the laws of affociation, are formed into distinct trains; which, like the genii of Adelin's lamp, appear the moment the enchanter imagination is disposed to call them. Without some pains taken in the cultivation of the faculty of conception, we may learn to criticize upon the laws of taste, but we shall never be subject to its influence.

In creating a susceptibility to the emotions of taste, we shall find a powerful assistant in devotional sentiment. The mind that has been accustomed to associate the ideas of Infinite Power, Wisdom, and Goodness, with all that is striking in the works of nature, must have a peculiar tendency to the emotions of sublimity and beauty. It is thus that sensibility may be properly and effectually awakened. The train of thought which devotional sentiment excites, is so highly savourable to the cultivation of refined taste, that I greatly question,

whether its emotions were ever excited, where fenfibility had not been thus called forth. So necessary is it towards the perfection of the human mind, that the cultivation of the affections should go hand in hand with that of intellect!

It is no finall incitement to the cultivation of taffe, to reflect, that the emotions of fublimity and beauty are connected, not only with our devotional, but with our moral feelings. They coalefee not with any of the diffocial or malevolent paffions; and can never be experienced while the mind is under their influence. By rendering the mind fusceptible of the emotions of taffe, we not only expand the circle of human pleasures, but as every emotion, of which the heart is capable, has a tendency to produce emotions that are in the same key, we give an additional chord, if I may so express it, to the harmony of the virtues.

To those who are by their fituation in fociety exempted from the cares and perplexities plexities of business, it is of the last importance to have a fufficient number of fuch objects and pursuits, as may serve fully to little chance of being called forth, in any eminent degree, where there are no difficulties to stimulate the energies of the foul, and no object to rouze its activity. The love of knowledge is, indeed, an active principle; and for that reason cannot be too affiduously cultivated in the minds of curse of leisure: but if to the love of knowledge we do not add a susceptibility to the emotions of tafte, the mind will be apt to languish, and to feek refources in those fatal fcenes of diffipation, where every vir-

The emotions of tafte are, I believe, particularly congenial to the female mind; but it deferves our ferious enquiry, how

ALL BERFBAY

VOL. II

far the common mode of female education tends to cultivate, or to destroy, this natural susceptibility. When we hear a mother speak of giving her daughters a taste for music, and a taste for painting, we may, nine times in ten, conclude, that she means nothing more by the expression, than exciting in her children an ambition to exhibit to advantage their practical skill in these accomplishments. For this purpose, the methods generally adopted are obviously so fuccessful, as to render it unnecessary to suggest any improvement.

With the idea of excelling in those accomplishments is affociated every idea of glory and approbation. To render the road to excellence easy of access, diffidence and modesty are banished from the youthful mind; the veil of bashfulness is tom aside by vanity, and every art made use of to render the gentle pupils callous to the public gaze. Vanity, aided by example, and stimulated by ambition, does wonders.

The attention is exerted in the art of imitation, and its power is never exerted in vain. Where the best models are procured, the copies will in time be excellent. The Music-Master who has taste, will teach his pupils to make use of graces, which will ferve as a succedaneum for that which he has it not in his power to confer; and rapid execution must inevitably be attained by unwearied application.

All this may, I confess, be accomplished without the cultivation of a single faculty of the mind, excepting those of perception and attention; but to confound this paltry art of imitation with the idea of TASTE is no less absurd, than if we were to call the compositor, who arranges the types for an edition of Homer, the Prince of Poets!

The emotion of Tafte with regard to mufical composition, depends upon affociation no less than it does with regard to the other objects of our perceptions.

Single founds, we well know, are accounted agreeable or difagreeable, according to the ideas which they excite. On examination we shall find that those which particularly strike us as sublime or beautiful, never fail to produce certain trains of ideas in the mind; which, if accidentally broken, hilated. An inflance or two will fufficiently elucidate this truth. What found fo fubof a cart of stones in the street may be mistaken for it, and, while the deception lasts, will produce the emotions of fublimity in their fullest extent; but let us discover our mistake, and what becomes of the emotions nightingale have been well imitated on the stage; but did they there produce the same emotions of beauty, as when heard in the

Music, which is a continuation of founds, may, from the various combinations of which it is capable, be rendered highly expressive of the tender, the plaintive, the melancholy, the cheerful, or the gay. It may be rendered elevating or depreffing, foothing the foul to fadness, or exhilarating to the tone of pleafure. Now that every one of these various emotions trains of ideas connected by the laws of will dispute. The person who is not sufknowledge of the laws of composition, and the art of the performer; but this admiration is perfectly diffinct from the emotion of tafte. To obtain this species of applause, is the fole aim of a number of composers, whose ambition is amply gratified by the approbation of the vulgar who, either in his compositions or performance, can excite the emotions of sublimity or beauty.

That the number is fo few, will not be matter of furprife, when we reflect that the person who would call forth the emotions of tafte, either in the disposition of material objects, or in any of the fine arts, must be capable of entering into all those affociations that are connected with the tones of mind which he wishes to produce. Whatever rudely breaks these trains of ideas, utterly destroys the effect. Every person of taste, who has heard the Messiah of Handel performed at Westminster-Abbey, and at the Play-House, must be fensible of the advantage with which this fublime composition was heard at the former place, where every object tended to produce affociations in unifon with the tone of the performance. At the Play-House these affociations were forcibly broken, trains of discordant ideas obtruded themselves on the mind, and thus the effect was loft.

Why

Why is our church-music in general fopoor, fo deficient in fublime expression, and so ill calculated to produce the sublimity of devotional sentiment? Why, but because the sublimity of devotional sentiment was unknown to the composers. Had the musical compositions of David happily been handed down to us, I make no doubt, we should have in them examples of the elevated and sublime in music, which would have harmonized with the tone of his own inimitable poetry. (8)

From the tenor of these observations, I hope it has been made clear, that a taste for the fine arts can only be cultivated by the same means which must be employed to lay the foundation of taste in general, viz. a careful improvement of all the intellectual faculties. If the conceptions have not been rendered clear and accurate, and the attention rouzed to give them constant employment, so as to lay in a large stock of ideas upon every subject; if the judgment

[328]

has not been exercifed upon the agreement and difagreement of ideas; and if the powers of abstraction and imagination have not been called forth; it is impossible that the emotions of taste should ever be experienced. It is not by constantly practifing at a musical instrument, or by handling the pencil, that taste for painting or for music can possibly be acquired. But let the basis of taste be fixed, and then by rendering your pupils capable of the practical part of these accomplishments, you enlarge the sphere of their innocent enjoyments, and afford them the opportunity of communicating pleasure to others.

The mother who is fuperior to the chains of fashion, and who is capable of taking an extensive view of the probabilities of human life, as well as of weighing the talents of her children with accurate impartiality, will decide with wisdom and precision on the value of those accomplishments which must inevitably be purchased

at the expence of a large portion of time and attention. Does the mind appear destitute of that energy which is necessary to give a zest to the intellectual pleasures, she will readily perceive the advantage which may be derived to such a mind, from having at all times the power of gratifying itself by an elegant and innocent amusement. But if her children possess fufficient intellectual vigour to find full employment from other sources, she will, perhaps, content herself with cultivating in them that taste for the fine arts in general, which will at all times ensure them the most exquisite gratification.

To fuch minds fources of delight open on every fide. Every feene in nature prefents fome object calculated to call forth trains of ideas, which either interest the heart, or amufe the fancy. But if the time in which the mind ought naturally to be employed in accumulating those ideas, be devoted to acquiring a facility of execution

at a mufical instrument, it is evident no such ideas can be called forth. I once travelled four hundred miles in company with an accomplished young gentleman, who made, tary observation, and that was called forth by an extensive moorish fen, where he said he was fure there was abundance of fnipes! Read the observations of St. Fond, on going over the fame ground, and observe the rich variety of ideas presented to the man of science by objects which are to the vulgar eye barren of delight. Follow the elegant Gilpin through the fame tour, and mark the emotions which the various scenery of natural landscape excites in the mind of the man of tafte. Who that is capable of weighing the value of the mind's enjoyments in the scale of truth and reason, will not instantly perceive, how much the balance preponderates in favour of those who have fuch a rich variety of affociations, when put in competition with the superficially accomplished? Let science and taste unite in the same mind, and you prepare materials for a constant scast.

As painting is now become a fashionable accomplishment, little less generally cultivated than music, it may be expected that I should make a few observations that may particularly apply to it. It is a subject on which I have no affishance from the writings of others; in what I say upon it I have, therefore, no guide but my own feelings and my own judgment, and in such circumstances it becomes me to express myself with diffidence.

The pleasure we receive from painting appears to be derived from two very unequal sources. The first, and greatest, is from the emotions of sublimity or of beauty; which in painting, as in all other subjects, depend on the train of affociated ideas. The more perfect the work of the artist, the more perfect the emotion; which is so powerful in a mind of sensibility, that

it must be permitted, in some degree, to subside, before we are capable of examining with minute attention the sources from which it is derived. These are various, as design, expression, colouring, &c.; but if these were not in perfect harmony with each other, we may be assured the emotion of taste would not be produced in any powerful degree.

The fecond fource of pleasure in painting is the accuracy of imitation. This corresponds to the facility of execution in the musical performer; both are fources of a certain degree of admiration and surprise, but are equally distinct from the emotions of taste. Where taste has not been previously cultivated, painting will never advance beyond an imitative art; and as the happy imitation of nature depends upon vigorous conception, it cannot be expected that those who have not had their conceptions exercised upon natural objects, can ever produce any imitations which will be worthy

worthy of even this inferior species of admiration. Masters may, indeed, give them rules of perspective, and teach them to daub on abundance of pretty colours with striking effect; but if taste be wanting, the lessons of a Raphael will be thrown away. Examples, on the other hand, are not wanting to shew what progress in this delightful art may be made with little instruction from masters, where real taste is guided by judgment and warmed by a brilliant imagination. I have the pleasure of knowing many ladies who so excel; but not one uncultivated mind is of the number.

Talle in the form of ornamental decoration, whether in articles of drefs or furniture, is fo much under the influence of the tyrant fashion, that it can no longer be stilled a simple emotion. Fashion depends so evidently upon affociation, that it must be traced to that source by the least reslecting mind; but the affociations to which it owes its wonderful ascendancy, are

merely those which connect the ideas of esteem and admiration with the splendour of rank and elevated situation. The form of dress that is worn by those we account patterns of gentility, is associated with the ideas of respect and admiration, which we are accustomed to cherish towards those of a certain rank; or with the ideas of a distinction still more flattering, which constitutes the glory of gay and youthful beauty. When the same form of dress descends to the vulgar, the change that takes place in our affociations strips it of its adventitious lustre, and affixes to the very same object which had before called forth our admiration, ideas of meanness and contempt.

If the fovereignty of fashion be so abfolute, what use, you will say, is there in the cultivation of just and refined taste, which cannot overturn her decrees?

Notwithstanding the influence which fashion has over our opinions, taste has still a very important part to act; and if

true tafte (of which judgment is a neceffary constituent) were properly cultivated, all the evils arising from the powerful influence of fashion would be completely done away.

Taste rejects whatever is incongruous; it requires fitness and harmony, and therefore taste will always reject the affectation of fingularity. It will always, for this reafon, adopt the mode of the present fashion; but it will adopt it under fuch limitations, as are agreeable to its general principles. Wherever cultivated tafte prevails, one general fentiment, whether of simplicity or magnificence, will pervade the fcene. In the furniture of the house, in the economy of the table, the same predominant idea will be expressed; and every ornament will be rejected, that does not give additional force to the expression. If inanimate objects can be fo disposed as to produce an undivided emotion, furely the decorations of the human form ought to be able to produce the same effect. There true tafte must revolt with with inexpressible disgust from whatever does not perfectly harmonize with the character. Where purity, modesty, and virtue, dwell in the heart, it is not taste that will decorate the form with the fleering dress of the wanton.

A knowledge of the principles of taffe would teach our fex to preferve the appearance of modelty at leaft, even if the reality were wanting. In female beauty, I believe no one will deny, that foftness graced with dignity, modelty, gentleness, and purity, are ideas that perfectly harmonize with the object. Let these affociations be broken by discordant images, and the emotion of beauty will be no longer felt.

"But," fays Miss Pert, "young men are strangers to the emotions of talle; to please them other affociations must be excited. By dreffing in the stille of women of a certain description, we call up trains of ideas favourable to passion."

True, young woman; but know that the who glories in this species of conquest,

degrades herfelf beneath the rank of those she imitates, and stands upon the brink of a precipice, with nothing but a little pride betwixt her and destruction. Few, however, very few of the numbers who adopt modes of dress highly incongruous with sentiments of modesty, are influenced by any other motive than the desire of being in the very extreme of fashion. The cultivation of taste would modify this species of ambition in the young; and would lead those who have arrived at the sober autumn of life, to adopt that mode of decoration which harmonizes with the season. (c)

The principles of which I have here given an imperfect sketch, are of universal application. They extend not merely to the disposition of material objects, but have an important connexion with moral conduct and behaviour. It is in these principles that the laws of propriety originate. From them they derive their authority; and the period in which fashion

VOL. II.

gives

gives a fanction to fuch modes of conduct as the principles of tafte condemn, is the epoch of depravity.

It may now be expected, that I should proceed to give fome hints respecting the not, however, fwell the fize of my letter by laying down rules, which the foregoing investigation must have rendered in some measure unnecessary. I have endeavoured to prove, that unless we have assiduously cultivated the faculty of attention, and directed it to fuch objects as may enlarge the stock of useful ideas; unless we have awakened the curiofity, invigorated the we can have no hopes of introducing those trains of thought which are the loftieft exercife of imagination, or those affociations which are the fource of refined talte.

Where the preliminary steps have been taken, and Nature has granted to the character a common share of sensibility, the

preceptor will find the cultivation of imagination an eafy talk. True talke is more difficult of acquirement. But where the first faculties of the mind have been duly cultivated, and the pupil is then directed to such subjects as are calculated to elevate the tone of feeling, and awaken the sympathies of the human heart, there is no doubt that the principles of taste will be understood, felt, and practifed.

Should our efforts prove unfuccefsful, it is in the neglect of the early affections that we shall probably find the cause of our disappointment. If we have suffered pride, self-will, arrogance, hatred, envy, or any other malignant passion, to gain an ascendancy in the disposition, we need not expect that taste will be either felt or cultivated. Its emotions were never known to the felsish; they harmonize with the most generous seelings of our nature, and seek alliance with all the virtues! Adieu.

LETTER XI.

ABSTRACTION.

Explanation of the Term.—Use of Abstraction in Science, in Reasoning, and in the Conduct of Life.

[The readers of the former edition will perceive that fuch alterations have been made in the following Letter, as it is hoped will tend more clearly to elucidate the fubject upon which it treats.]

THE subject upon which I am now to enter, has so seldom been addressed to any but the learned, and so seldom recated but in the abstruse language of metaphysicians, that to reuder it familiar to such as have never been accustomed to read, to converse, or to think upon the operations of the human mind, may be not a little difficult. I am, however, encouraged to hope, that the difficulty is

not altogether infurmountable; being fully perfuaded, that many who never heard the term ABSTRACTION made use of, except when it was meant to denote absence of mind, are nevertheless possessed of the faculty, and capable of employing it to the best purposes.

Abstraction, as defined by Mr. Locke, is "that power which the mind has of "feparating an idea from all other ideas "that accompany it in its real existence." Thus, for instance, colour always exists in company with something coloured: but we can think and talk of the beauty of purple or of lilac, without combining the idea of these colours with a bonnet or a ribbon: and when we think of the colour independently of the thing coloured, it is an exercise of Abstraction.

When we fpeak of the duty of man as an accountable agent or a member of fociety, we do not fpeak of the duty of John or Thomas, or any particular individual,

but of Man in general, from an abstract consideration of his powers and situation, Without the capability of this consideration of the peculiar powers which distinguish the species, it would be impossible to reason upon the subject of his duties.

All claffification depends upon the power of attending to fome general qualities characteristic of a species, so as to arrange all the individuals in which it is found into one distinct ciass. In objects of science these are again divided and subdivided, so as to abridge the labour of scientific refearch. It is by this previous arrangement, that the naturalist, who vifift diffant regions, is enabled, upon an examination of new and unknown objects, either in the animal or vegetable tribes, to pronounce with certainty upon their habits and properties. This claffification may properly be called the grammar of science. And its use may, perhaps, to many of my readers, be best exemplified by the advantage that is derived to language from the claffification of words. When, in learning a language, we refer each word to its proper station, as noun, verb, or preposition, we must exercise the power of Abstraction; fixing our attention upon the power of the word, without any consideration of its meaning. While we are thus employed, to love and to bate appear words of the same class, no other idea but that of verb being attached to either.

Nor is the power of Abstraction less necessiarily employed in every process of reasoning, than in the classification of scientific philosophy. Wherever the truth or falshood of a proposition is not immediately evident, it must of necessity be explained by a chain of intermediate ideas; the reasoning being termed close, or diffuse, as these are more or less intimately connected with the proposition in question.

Having feen how much the use of general terms facilitates the labours of the

scientific philosopher, we shall more easily comprehend the advantage of having clear ideas with regard to the general terms employed in every process of reasoning. To explain this by a familiar example.

Substantive is a general term used by the grammarian in the claffification of words. A child, who has been taught grammar, will, if you ask to what class the word table belongs, immediately tell you that it is a noun fubstantive; nor will any idea concerning the shape of the table, or the substance of which it is composed, intrude to create confusion. Very different, however, is the case with regard to those general terms which convey ideas upon moral subjects. The different fenses in which, from the poverty of language, we are frequently obliged to use the fame word, forms without doubt one great cause of obscurity; but the difficulty of abstracting the mind from all consideration of particulars will be found in all

[345]

our reasonings a still greater source of confusion.

Let us suppose that patriotism is the fubject of discussion in a party where every person present, instead of a fixed attention to those peculiar qualities which are properly fignified by the general term patriotifm, refers in his own mind to some individual with whose idea the term is affociated. It is eafy to imagine what various and contradictory opinions will be advanced. One perhaps attaches" to the term the idea of fome turbulent demagogue, and classes it accordingly with fedition, conspiracy, and rebellion. Another connects it with the idea of an Epaminondas, or an Ariftides, and speaks of it with enthusiasm as the first of virtues. A third, having got the fimple definition of patriotism as the love of country, considers the narrow, felfish, and unenlightened partiality which he indulges for the place of his nativity, as a proof of his poffelling all

the patriotic virtues. Is it not evident, that if each of the above-mentioned difputants had obtained a just and comprehensive definition of the word patriotism, and kept it steadily in view, no difference could have subsisted between them concerning its merit or utility?

By the explanation that has been given of the laws of affociation in feveral parts of these Letters, the impossibility of carrying on any just or comprehensive train of reasoning, while the mind is perpetually referring to particulars, will clearly appear. Whenever our ideas concerning any moral quality or action are formed, not from an abstract consideration of the quality or action under consideration, but from the particular individuals who possess or practife them, a thousand casual affociations unavoidably attached to these individuals will bias the mind and pervert the judgement. Hence arise those inconsistencies in opinion and conduct, with which we fo

frequently meet in persons of good hearts and ardent imagination, but who, from being incapable of general reasoning, change their notions of vice and virtue. merit and demerit, as they are led by their passions and prejudices to approve or to condemn individuals. What in a favoured friend they extol as meritorious, they consider in an adversary as wicked and indefenfible. To every part of the condul and to all the opinions of the person they love, they attach the ideas of right; and to the whole of the conduct and opinions of those they hate, they attach the idea of wrong: the refult of those false affociations on their own conduct we can be at no loss to determine.

Until we attain the power of difengaging our minds from these false affociations, we can neither reason, nor understand the reasoning of others; and as the attainment of this power depends upon the exercise of the faculty of Abstraction, it follows. follows, that without the cultivation of this faculty we must remain, in a great measure, the slaves of sense and prejudice. Strict integrity, and a firm adherence to the dictates of conscience, will preserve from gross errors in conduct, where the path is obvious and free from all perplexity; but where any intricacy occurs, the mind that is destitute of general principles, will for ever be in danger of being led astray. Hence arises the advantage of deductive reasoning, by which alone general principles can be established.

Until these principles are thus fixed in the mind, the observance of many moral and religious duties will depend solely upon habit and situation. Let us suppose two young persons, who have been from infancy accustomed to the performance of the duties of public and private devotion; the one, enlightened by clear and diffined views of the principle upon which the propriety and utility of those duties is established;

established; the other performing them from no other motive than the example of the fociety in which he lives, and the affociations of duty and propriety. Suppose them both to be fent forth into the world. Which will then be most likely to adhere to feene is changed, is it not probable that new habits will be formed, and new affociations arife, which may affix to the observance of public and private devotion ideas of who depended on habit and affociation folely: while he who is enlightened by more comprehensive views, will remain uninfluenced by the habits and opinions of those with whom it is now his face to be

Of two young women that have had the misfortune to be married to men of diffolute characters, will not fhe, who is capable of taking a general view of her duties as an accountable and intelligent being, have a manifest advantage over her who has always been confined to the confideration of particulars? The former, fixed by principle, will remain firm in duty, acting from the affurance that the most flagitious conduct of him with whom she is connected, can not absolve her from obligation to its performance. The latter will ever be in danger of considering the conduct of her husband as an excuse for her own. The same observation will apply to all who have enlisted under the banners of party.

The partizan weighs no opinion in the impartial scales of truth. It is sufficient for his sanction, that it is adopted and supported by the side which he espouses. The consequences have already been hinted at in one of my former Letters upon the improvement of Judgment, the exercise of that saculty being the first step towards preventing a tendency to the reception of prejudice; but when prejudices have been

already imbibed, it is by abstract reasoning alone upon the nature of things that they can be detected and overcome. I shall illustrate this by instances from opposite characters.

When the zeal of bigotry has been early and fully imbibed, it will be confidered not only as a prerogative, but as a duty, to denounce the vengeance of GoD and his eternal reprobation against all whose metaphylical and speculative opinions upon party whose tenets have been esponsed. By particular texts of fcripture this rash judgment will perhaps be justified. But let the reasoning faculty be employed, and it will be acknowledged, that on subjects fo far beyond the sphere of human knowledge as, but for the light of Divine revelation, to be involved in darknefs, it becomes us to pronounce with humility. It will be feen that the spirit of the gospel breathes charity and love; and that its tenour is not only glory to Gon, but good-will to man.

Without the capability of fuch comprehenfive views, the spirit of bigotry will be apt to produce a re-action leading to infidelity. Instead of confidering the tendency of the gospel dispensation, and its admirable adaptation to the principles of the human mind, and the circumstances of the human race; the fceptic confines his objections to particulars, and from a few passages that appear to him incomprehenfible, rejects the whole. It is among those who have formed their opinions from views equally narrow, that he will be molt likely to make converts; and these converts will become bigoted in infidelity, in proportion as they have imbibed that spirit of opposition which is inseparable from party prejudice. It is a fatal mistake to imagine that the cultivation of the reasoning powers is inimical to faith or picty; and it is not ttle furprifing, that fuch a miffake

fhould, in any inftance, exist among those who have studied the writings of the Apostles.

From the little pains that have commonly been bestowed on the mental cultivation of our fex, it is not furprifing that the powers of Abstraction and of generalization should be fo very feldom met with. Happily in the fphere in which it is most frequently our lot to move, these are not fo indispensably requisite, as that found judgment which is vulgarly denominated common fenfe. The duties of mankind in general, and of our fex in particular, are oftener active than speculative: and an ever wakeful attention to the minutiæ of which they are composed, is absolutely effential to their performance: but those who would, for this reason, deny the utility of cultivating the higher powers of the mind, ought, by a parity of reasoning, to confider gold as ufelefs, because small coin is more frequently requifite in transacting the common business of the day.

To fuch as fill subordinate situations in fociety, whose wills are necessarily subjected to the wills of others, the capacity of exercifing the judgment upon the fimplest propositions may be quite sufficient: but to fuch as are placed in an opposite situation, who have not only to chuse their own path, but to govern the wills and direct the conduct of others, a more extensive of no two perfons is exactly fimilar; when, therefore, those opinions which influence our actions, are the refult of our observations upon individuals merely, without any reasoning upon first principles, we must infallibly be exposed to error. Nor can we, without the capacity of reasoning, enter into the reasoning of others: while destitute of this power, we are for ever liable to mistake, and go on perverting and mifapplying every general observation by a false reference to particulars, instead of reaping the advantage we might derive

from examining its truth and confidering its utility. Addison employs upon this subject much of that charming irony of which he was completely master. I dare say you recollect his account of the lady, who, on reading "the Whole Duty of Man," discovered in the description of those vicious propensities, against which the pious author endeavours to guard his readers, the characters of her friends and neighbours, and by regularly recording their names upon the margin, converted a system of Christian morality into a libel upon the whole parish.

It has been afferted, that few err through ignorance of their duty: and under certain limitations the affertion may be just; as there are few fo ignorant as to be infensible to a glaring deviation from moral rectitude. But when the path is smoothed by fashion, and filled by numbers, the defect becomes so easy as to be imperceptible to such as are incapable of taking those bearings which accurately mark the moral distance.

. The prefent and immediate confequences of our actions are feldom alarming, and to the remote confequences it is only reason that can look forward. Were mothers more frequently capable of this exertion of intellect, education would no longer be guided by the caprice of fashion. But where mothers have never been raught to reason or to think, are fathers therefore absolved from the parental duties? Have their offspring no claim upon them for improvement and instruction? Let them confider how far they are accountable for the future conduct of their children. Let them lay afide all prejudice, and taking a fair and impartial view of the influence of the female fex upon the manners and morals of fociety, confider, how far they are justified in neglecting and contemning the cultivation of that faculty, which is not only effential to principle, but which, by

its influence over the passions, has a tendency to promote the harmony of social life.

In this point of view Abstraction has seldom been contemplated: but I hope the following observations will elucidate the truth of my affertion.

It is by habits of implicit obedience that children must be taught the subjection of felf-will, long before the powers of reason begin to operate; and by habits of obedience that they can only be preferved from the many evils attending youth and inexperience. But as life advances, and parental authority oppofes what is urged by inclination, will obedience be always yielded without murmuring? Will judgment never decide against the justice and propriety of the parental distate? Authority may be capricious, and against caprice and tyranny indignation and refentment are ever ready to revolt. What is the confequence? Either fullen and forced compliance with the dictates of supposed injustice,

or the triumph of felf-will over parental authority. I am afraid fimilar instances may fometimes occur in other connexions. In truth they must frequently occur, whereever the connexion is of fuch a nature as to give one party power over the will of another. Ought fuch power, then, to be annihilated? Would the happiness of doof a family were to do that which was right in his own eyes, or rather that which present inclination prompted? So those whose confined and parrow views extend ticulars have afferred. But reason takes up the question upon other grounds. It weighs the inestimable advantages of domestic union, amity, and concord. When put into the scale against these, it finds the trifles which are the causes of contention as dust in the balance! The child who has been accustomed thus to reason, will yield the tribute of filial obedience with

with cheerfulness, nor grudge the price of that facrifice which strengthens the bond of domestic peace.

The fame cause which produces rebellion on one part, generates an unpardonable love of domination on the other. The parent, who acts from the steady dictates of principle, will not lightly inflict the pain of disappointment. She who is capable of comprehending and acting up to her duty as a mother, will entertain no apprehenfion of lofing her authority, though occasions of exerting it should not often occur. In well-regulated families theywill indeed occur but feldom: in cultivated minds those trifles, which are the most frequent causes of family diffention, lose their importance, felf-will becomes confequently less concerned about them, and thus a fruitful fource of irritation is cut off. In the domestic intercourse of uncultivated minds the subjects of conversation (if conversation it can be called) will always

be found fo connected with the felfish feelings, as to occasion dispute and opposition. Unhappy they who are obliged to liften to the din of fuch jarring elements! but still more unhappy those, who, from having no nobler objects on which to employ the activity of their minds, are thus compelled to waste their precious hours in reaping stubble and grinding chaff. We have already had occasion to observe, that whatever tends to prevent the recurrence of the felfish and malevolent paffions, diminishes their influence; and it is no fmall confirmation of this theory, that those who have most successfully cultivated the power of Abstraction, are remarkable for ferenity of temper. By taking comprehensive views of human character, they avoid all molestation from those occasions of offence which engage the felfish and short-fighted in perpetual warfare. A cafual act of kindness from the vain or capricious will not excite in fuch minds expectations of steady friendfhip; nor, confequently, when a contrary line of conduct takes place, will it call forth the bitterness of resentment. The more nearly we become connected with individuals, the more does the capability of taking fuch general views of character become effential to our peace. For as the merit of the very best of characters is nothing more than the preponderance of good qualities over bad ones, those who are unable to make the estimate, and who confine their observation to particulars, will confider the flightest blemish as a counterbalance to a thousand virtues; or, should they meet with any thing attractive, will build upon the basis of a few extraneous graces expectations that may wound the heart.

If there be indeed any foundation for the objections that have been made to these Letters, on account of their being too abstructe for the comprehension of the generality of mothers, it affords additional proof

proof of the bad confequences refulting from fuch a narrow education as precludes the possibility of exercising the reasoning powers. Few of the objectors, however, having been of my own fex, I am inclined to believe, that the number capable of pursuing the subject is far greater than they would suppose, whose acquaintance is confined to a narrow circle, and who form their opinion from the trifling tenour of common conversation. Whatever such may think, it is not in the incapacity of my fex that I expect to meet the most formidable obstacle; but in those false affociations which connect the idea of feminine foftness with folly and imbecility, and unite to strength of intellect notions

LETTER XII.

ABSTRACTION.

Character of those who object to the Cultivation of the Reasoning Faculty in the Female Sex.—Other Objections stated and examined.—Means to be employed in preparing the Mind for the Exercise of Abstraction.

MY DEAR FRIEND,

HERE a confined education, an injudicious culture of the intellectual faculties, or the purfuit of mean and grovelling objects, have rendered a man incapable of enlarged and elevated views, it is not furprifing, that he should contemn the powers of general reasoning, (especially

ally in our fex;) as they give that manifelt fuperiority to the possession, which pride must be pained to feel, and mortified to acknowledge.

The less the faculty of Abstraction is cultivated, the less chance there is, that the mind will ever rise superior to the influence of early affociation. It is by taking an abstract view of the real nature of things, that early prejudice can in any instance be conquered: and where the mind is incapable of such views, we must expect that prejudice will continue to operate for ever.

Far, therefore, from being furprifed at the mean notions entertained by men of narrow minds concerning the cultivation of the female understanding, we should learn to expect such sentiments, as the inevitable consequence of early prejudice and shallow intellect. Were this deeply impressed upon our fex, it would prevent the misery of disappointment: as the woman who is capable of reasoning, and

unites herfelf to a man of inferior capacity, in the vain hopes of obtaining an acknowledged afcendancy, feldom fails to be convinced of her error, when it is too late to admit of remedy.

The advocate for the cultivation of female reason has other enemies to contend with, besides those of the above description; enemies, who, as they use the positioned weapons of flattery, and seek to gain the passions over to their interest, are far more powerful adversaries than the proud, the prejudiced, or the ignorant.

Where the passions have been cherished rather than the affections, the qualities that excite emotion will be preferred to the virtues which command esteem. Unfortunately for our fex, reason, and its attendants, prudence and propriety, are discovered to be productive of associations connected with no emotions save those of complacency. No wonder, then, that the voluptuary, in whatever degree he may

himself possess the powers of intellest, should be adverse to female cultivation.

That the sprightly prattle of unthinking folly should sometimes be found an agreeable relaxation, even to the philosopher, we must be willing to admit: but whenever it is systematically preferred by a man of sense, that man, however grave his deportment, or unblemished his reputation, will, if he candidly examine his motives, find them influenced by passion. The emotions in which he delights, are not connected with delicacy of sentiment, or elegance of taste; and in his disposition the selfish affections will be found to have obtained an ascendancy over the social.

It is for the fake of the affociations it excites, and not for the efteem it produces, that the melting foftness of sictious sense bility has had so many admirers among the sensible part of mankind. The real virtues of modesty, gentleness, and humility, produce sentiments of esteem and complacency;

complacency; but though in a mind of delicacy these sentiments may touch the heart with emotions still more tender, they can not be expected to make much impression, unlesswhere these virtues are so thoroughly understood as to be properly appreciated. Not so with all the long et cetera of semale weaknesses. A dear creature crying for she does not know why, or palpitating with terror at she does not know what, excites, by her tears and her terrors, associations of tenderness that produce emotions, which, though very foreign to those of esteem, are nearly allied to passion.

By those who confider such emotions as superior to every species of intellectual enjoyment, we may be affured the cultivation of intellect in our fex will never be countenanced or encouraged. To the younger part of our fex, they will deem such cultivation to be injurious; and to the married women, they contend that it is useless. But is it really so? Does it never happen, that

a woman, from being incapable of taking a comprehensive view of her own and her husband's interests, unwittingly contributes to the ruin of both? Does no inconvenience ever arise from the pursuit of pleasures, which reason would disapprove? Do eager disputes concerning trisles never throw a little mud into the perennial stream of matrimonial felicity? Let these questions be answered by experience, and whatever may be pronounced with regard to youth and beauty, the cultivation of the reasoning powers will to the married woman be allowed not altogether unnecessary.

Even as the miltress of a family, how should she, who is incapable of forming a general view of causes and consequences, arrange her plans in such a manner as nicely to proportion her expences to her income? How is she to direct the conduct of many individuals to the accomplishment of one general end, who is incapable of forming a distinct idea of the end proposed?

Observed

Oppressed by the labour of prying into particulars, she will consider herself as the very paragon of good housewives; and after having been uselessly busy from morning till night, will wonder to find the result of all her pains

" Confusion worse confounded!"

I know not, indeed, whether the generalization of ideas be more requisite to a minister of state than to the mistress of a family. How necessary it is to the former, has been displayed by the elegant and judicious author of the "Elements of the "Philosophy of the Human Mind;" its use to the latter is a more becoming theme to the Author of this humble performance.

A large family is a complicated machine, composed of a great number of individual and subordinate parts. In order to conduct it properly, there must, in the first place, be a comprehensive, i. e. a general view of the effect desired to be produced;

[370]

in the next place, there must be an accurate conception of the powers of each separate wheel, or individual agent, and a just notion of how it can be employed to the best advantage; and lastly, a distinct view of how the whole is to be fet in motion, so as most eafily to produce the defired effect. It should ever be so constituted, that, like the filk-wheels at Derby, when any one part goes wrong, that part may be stopped and repaired, without arresting the motion of the rest. Now it is clear, that the direction of fuch a machine depends upon too comprehensive an arrangement of ideas, to be ever attained by an attention to particulars. This arrangement is the work of generalization. The miltrefs of a family who is capable of it, does more in minutes than others effect in hours. It is worthy of your observation, that the management of a family, far from being an avocation of that mean and degrading nature, which, by some ill-advised advocates for the rights of our fex, it has been injudiciously represented, calls forth all the faculties of the mind which have passed in review before us. If there be a material deficiency in any of these faculties, it will never be in a wife's power, however much it may be in her inclination,

"Well-ordered home, man's best delight, to make."

It is well observed by Lavater, that "buftle" is the effort of indolence." Where the mistress of a family possessed quick perceptions, vigilant attention, accurate conceptions, found judgment, and the capability of general arrangement, buftle will be unknown.

If the power of generalizing her ideas be effential to the woman who is still blest with the directing counsel of parent or husband, how much more so is it to her who is left in a state of widowhood with a family, who look to her for support and protection? In the management of their affairs, what can the poor orphans hope for

from the conduct of one who can neither reason, nor understand reasoning? Let the men who confider imbecility as the chartered right of woman, fay, how far a being that is incapable of extending her views beyond the filly gratification of the filly wish of the present moment, can be supposed adequate to the performance of a double duty! Even granting a more favourable supposition, and admitting that she has that degree of judgment which can decide properly upon common affairs, if this judgment has only been exercifed upon particulars, how will she be capable of forming a proper estimate of the plans of conduct most likely to conduce to her family's interest and happiness? Like a tyro at chess, she is incapable of calculating beyond a fingle move; and that move is prompted, not by a diffinet view of the relative fituation of all the pieces on the board, but by the temptation of winning an unguarded pawn. She takes the step, exulting in her discernment; and, when too late, beholds a train of confequences which were till then unfeen and unexpected; and deplores, as her unhappy fate, what was the natural refult of her narrow views and untutored skill!

Alas! how many promifing families have dwindled into infignificance, or become the prey of vice, not from a want of the maternal tenderness, but from a deficiency in the maternal intellect? And who can tell to what the little girl, who now prattles by their fide, may hereafter be deftined? In the cultivation of her faculties the happinels and prosperity of a numerous race may be involved. Is it by the light of imagination she is to direct their course? Is cultivated tafte fully equal to the important task? Is it by musick and by dancing that she is to instil principles into their tender minds? Or is it all of these combined, which will enable her to act her part on the theatre of life with dignity and honour?

To a deficiency in the powers of general reasoning must we ascribe, not only the ininjudicious management of education, but the fubfequent neglect of those accomplishments to which education has been folely female youth are made subservient to the being studied merely as languages, accomplishments, without any central point or removed from school, than her attention is completely estranged from pursuits, to which the whole of her time and attention had been hitherto devoted. Of the cletached pieces, isolated fragments of an unfinished fabric. They are not considered they applied to as refources, with which to give interest and dignity to domestic retirevanity, they are confidered as useless, are consequently neglected, and at length forigotten. Happy they who are blest with parents, whose enlarged minds are capable of comprehensive views! In their education there is nothing vague, defultory, or unconnected. Every branch forms an integral part of a great whole; all tends to accomplish one definite end. The acquirements of youth are thus rendered instrumental to the happiness and usefulness of after-life, and even the amusements of childhood, by the trains of ideas they have introduced, made a source of enjoyment to age!

By the mother who is incapable of general and extensive views, the education of neither fex can be conducted with propriety; for by such the effects of present conduct upon future happiness can never be foreseen. When you speak to such mothers on the subject of education, they agree with every thing you say. Ever ready

to admit the force of your arguments, and to coincide in your opinion concerning the vast importance of education, you exult in having convinced them, and expect to fee an immediate change take place in the reprehenfible part of their conduct towards their children. But alas! your expectations are fruitless, your hopes are vain! Without the capability of generalizing their ideas, they cannot fee the relation which every particular part bears to the whole; and therefore, though they admit your opinion upon the whole to be just and proper, they do not perceive how it concerns any particular point, and with the best intentions in the world, go on in their former track, nor give one glance towards

The conduct of these good ladies in this particular is exactly similar to that of the Christian world in general with regard to religious principle. All acknowledge its excellent tendency upon the whole, though

few permit themselves to judge of every practice according to its spirit. Superstition and infidelity equally rest upon particulars. The cloistered monk, who, in the days of ignorance, venerated the paring of a faint's nail, and fought the favour of God by a life useless or injurious to man, had not views of religion more confined than those of the sceptic, who makes such instances an argument against the truth of the Gospel. It is in the want of those comprehensive ideas which embrace the fpirit of the Christian doctrines, while the conceptions are employed on the adventitious circumstances connected with it by affociation, that perfecution in all its degrees, and bigotry in all its branches, havehad their fource. And by views of education equally circumscribed has the progress of the human mind been fettered, and the developement of its superior faculties rendered fo rare and uncommon, that the advantages attending it are feldom understood.

With

With regard to the cultivation of abstract reasoning, it must indeed be confessed, that other objections have been started, which at first view appear of so ferious a nature as to be not a little alarming; and as these objections have had weight with those who are superior to the illiberality of prejudice, they well deserve our minute enquiry and anxious investigation.

The most forcible argument produced against the cultivation of the reasoning powers, is inferred from the conduct of individuals, which is such as to authorise the affertion—that those who reason best, frequently act as if they had no reason at all. Powerful as this argument may appear, it is not the only one urged against the utility of abstraction; as every person conversant with scholastic disputes can witness, that there is no doctrine however absurd, no action however immoral, that abstract reasoning has not been employed to justify and enforce. Even the ingenuous and

venerable Reid observes, that "when rea"foning is used to justify what a man has
"a throng inclination to do, it will only
"ferve to deceive himself and others; and
"that when a man can reason, his passions
"will reason, and they are the most cur"ning sophists we meet with."

Instead of being appalled by these proofs of the infufficiency of the reasoning powers, I rejoice in the opportunity they afford me, of still more amply elucidating the principle upon which I have all along proceeded, viz, the absolute necessity of paying a duc attention to the cultivation of the first faculties which appear in the human mind; and which, by the wife Author of nature, were evidently intended as the basis of the fucceeding faculties. That to a neglect of these primary faculties all the instances of the inutility of the reasoning powers may be fairly traced, I am thoroughly convinced; for as foon should I believe, that respiration injures the circulation of the blood, and that the heart would perform its office better, if the lungs were taken from the human body,—as that any of the mental faculties with which the ALMIGHTY has graciously endowed his intelligent offspring, were intended to be either useless or injurious!

Leaving the inflances of mifconduct in the reasoners of the other sex to more able investigators, I shall confine myself to a particular examination of those popular and plausible arguments, by which so many have unfortunately been convinced of the impropriety of cultivating the semale understanding.

It has been observed, that women who have reasoned upon subjects of abstract speculation with much skill, have shewn in their conduct neither judgment, nor propriety, nor a delicate sense of moral restitude: that they who have been most remarkable for talents, have not always been most remarkable for virtue: that genius has frequently led to error: and that semales

who have cultivated the higher powers of the understanding with most success, have manifestly neglected the peculiar duties of their fex and situation. It is moreover observed, that though men of talents and learning are generally modest in proportion to the superiority of their attainments, vanity is commonly the companion of every species of superiority in our fex.

Heavy charges! humiliating picture of female imbecility! How shall I answer to my fex for their exhibition? Believe me, my fair Friends, that could I, in analizing the instances which have been here brought forward, trace them to no other source than such an inferiority in the intellectual powers as renders the attainment of the speculative faculties incompatible with the exercise of the active duties, I have too much of the woman in me not to endeavour to keep our own secret. But if to a defective education all the errors alluded to may be fairly traced, I shall, instead of censure, hope to receive the meed of approbation.

Often does the ill-judging vanity and pride of parents lay the foundation of such characters as have been above described. The over-educated and the un-educated are equally incapacitated from making a proper use of their faculties. The conceptions of the former having been stretched to embrace abstract propositions, at a period when they ought to have been strengthened on the objects of perception, become dull and languid as to those objects; and the judgment having, like the conceptions, been exercised upon speculative enquiry, before it had been improved upon simple propositions, has neither soundness nor vigour.

Parents may flatter themselves, as much as they please, concerning the extraordinary progress of the child, whom they have anxiously endeavoured to render a phenomenon of science or literature at an early period; but future experience will prove, that, wherever the higher faculties have been unnaturally called forth, before the

earlier ones have acquired fufficient strength, the character will, upon the whole, be weak and imperfect. Where there are strong powers of conception, imagination will, in children whose education is thus pushed forward, exert an early influence, and often do the observations which pass for reason in such children, originate in no other source. Imagination becoming thus predominant will frequently usurp the place of judgment in the processes of reasoning; and when reasoning, which ought to be a feries of judgments, is thus converted into a feries of brilliant combinations, what can we expect as the result?

Imagination is of all the powers of the mind that which is most liable to the influence of passion. By passion, therefore, and by early affociation, will the abstract reasonings of persons of uncultivated judgment be directed.

Where education has been injudiciously conducted, such falle affociations must of necessity necessity take place, as have a manifest tendency not only to pervert the judgment, but to corrupt the heart. These affociations create the pride of superiority on account of acquirements, which ought only to be estimated according to their use. Whatever is not brilliant in talents or in conduct is despised, what is merely good and useful is held in contempt. Can it be supposed, that minds thus formed should pay much attention to the duties of domestic life?

The fame fundamental error in education renders the characters which are formed by it, prone to embrace opinions which are at variance with found principle. Whereever the imagination has been called forth, and judgment is fuffered to lie dormant, the mind will be apt to be led aftray by every brilliant novelty, however false or dangerous the doctrines to which it leads. To detect fophistry is the province of judgment; and where judgment is weak, and imagination strong, we may be certain

that, instead of being detected, it will be cherished and supported (H) Hence the race of semale free-thinkers; not one of whom, as far as my observation extends, have had their faculties regularly cultivated.

Even where the judgment has been exercised upon abstract propositions with such success as to prevent its mistaking sophistry for truth, though the reasonings may be just and accurate, the conduct may still be ridiculous and absurd. This may, at first view, appear paradoxical; but if you consider what was said upon the faculties of attention and conception, the problem will be quickly solved. Where those faculties have been neglected, present objects will make no impression; and an ever-wakeful attention to present objects is so effential towards the performance of every active duty, that without it there can be no propriety in behaviour, no regularity in conducts.

Where the conceptions are flow with regard to all but speculative truths, there vol. 11. c c c

can be no knowledge of character; confequently the opinions of fuch perfons, with regard to the merit or demerit of individuals, are founded, not on folid judgment. the ardent likings and capricious hatreds of persons who boast no common share of genius, but who are destitute of judgment. The likings of fuch perfons we shall, however, find to be without affection, though their hatreds are not always free from malignity. It is in what may be called the leffer sympathies that affection has its thefe fympathies can have no existence; for to enter into the feelings and interells of others without lively attention and conception, is impossible. Those who feel not fympathy, can never be the objects of lympathy; fuch characters, therefore, may excite admiration, but they will never

The faculty of abstraction, where the previous faculties have been regularly col-

tivated, has a manifest tendency to allay the fervour of passion, and to controut the impetuosity of desire. Far otherwise, however, will it be found to operate, where it is under the dominion of imagination; reason will then be enlisted in the service of the passions, and employed to justify what found principle and sober judgment must condemn. It might feem invidious to point our instances to illustrate the truth of this observation: but no one who has been conversant with the world, or with books, can fail to be acquainted with them.

The most important part of education is that which a man gives himself. But if the foundation of this self-instruction has not been laid in the early cultivation of judgment, and the faculties which precede it, the self-instructed will be liable to errors in opinions and in conduct. Where the ground is permitted to lie fallow, weeds will assuredly spring up. If care be not taken in our early years to give those afforciations

fociations which are favourable to found principle and rational conduct, affociations may take place highly unfavourable to both.

The female who, after a deplorable deficiency of early education, possesses sufficient energy to fet about acquiring information for herfelf, labours under peculiar disadvantages. She may devote her time to study, but if she have not judgment to direct these studies, pride and pedantry will be the probable refult. A multiplicity of ideas without arrangement are, in reality, very useless to the possessor; yet such is the inevitable confequence of that defultory reading, which by our fex is so often miftaken for knowledge. Nor does the whofe judgment is uncultivated gain much by confining her refearches to one particular object; for by imagination will the value of that object infallibly be magnified, so as to render all others comparatively mean and infignificant. Hence proceeds an ardent zeal concerning speculative points of doctrine; a zeal which, it may be observed, daries which mark the fphere of human knowledge. Frequently have I known the feeds of difcord and animofity fown in private families by the ill-judging ardour with which fuch points have been opposed and defended; but never did I know an enlarged and comprehensive view of the doctrines and fairit of Christianity bring forth other fruits than those of peace and love. By the union of judgment and generalization these comprehensive views are produced; but by abstraction without judgment, we have only an exaggerated view of the importance of those points upon which the mind has, from fome peculiar circumstance, been led to dwell: no wonder that the duties of life should be despised by those whose attention is solely engrossed by fubjects from which they are quite remote.

The tendency of the cultivation of the fuperior faculties to promote vanity in the

fex, was the last of the objections stated. In order to oppose it, we need not change our ground; for never shall we find the reasoning powers productive of vanity in a well-regulated mind. Where the judgment has been taught to appreciate the real value of every object of pursuit, and the idea of fuperior excellence has been firmly affociated with the proper discharge of the religious, the moral, and the domestic duties; where the heart has been early taught to bow with reverence to virtue, however humble the garb in which it is found; and the conceptions enabled to enter into the characters and feelings of others; there the mind will be in no danger of being inflated with vanity, on account of a conscious superiority in the reasoning powers. Persons of this defcription will, on the contrary, be often humbled by a confcious fense of their inferiority in point of real worth, when comparing themselves with those who boast

not the fame advantages. Such humiliation is falutary to the foul, and dangerous is the state of those who have never selt its influence.

In all the instances which have come under our consideration, it is evidently not the cultivation of the reasoning faculty, but a desiciency in the faculties of attention, conception, and judgment, which have occasioned a departure from the path of duty and of common sense. Though in these instances I have consined myself to my own sex, the same argument will doubtless be found to apply with equal force to the other; speculative men, who are incapable of condusting the common concerns of life, being little less frequently met with, than reasoning women who are neglectful of its duties.

To those, who from an enlarged view of the advantages to be derived from the cultivation of the powers of abstract and general reasoning, are desirous of laying the

[392]

foundation of these powers in the minds of their children, the following hints may not be altogether unacceptable.

It has been supposed by some philosophers, that the vegetable mould which covers the greatest part of the terra firma of our globe, carries in its bosom the feeds of all plants, flowers, &c. and that thefe, for the greater part, lie dormant only for want of proper flimuli to bring them forth. However this may be with regard to the vegetable world, we can have no doubt of the truth of the theory, when applied to the human mind; and were we to bestow our attention in discovering the means that are best adapted for exciting its latent powers, instead of employing all our pains in rearing in it a few fickly shrubs of our own planting, we should be far more amply repaid for our labour. The faculty of abstraction, like all the other powers of the mind, wants only the proper degree of excitation, in order to expand and become

[393]

productive. But it must be excited with caution, and by no means permitted to outgrow judgment, beneath whose shade it ought to be reared, nourished, and brought to maturity.

From the explanation given of the ufe clear and accurate conceptions of the fufficiently obvious. The definition of words ought to form a part of the daily occupation, from the time that the mind is capable of just and accurate conceptions. As the pupil advances in knowledge, exercifes upon words that are nearly fynonimous will be highly ufeful, and may be rendered very amufing; and as, from the poverty of language, the fame word is frequently used in a variety of senses, it will be of infinite importance to have a ready and quick apprehension of the different meanings attached to every word. This can only be attained by constant exercise;

nor can it be fully attained, till a large flock of ideas has been acquired; but if this exercise of the mind is begun at an early period, and unremittingly pursued, the number of ideas acquired from reading or conversation will be increased in an incalculable degree.

An accurate conception of the meaning of words, belides increasing the number of ideas, is an excellent preservative against those false affociations which engender prejudice. Many are the bitter disputes which an accurate knowledge of the affociations attached to the words made use of by either party, would effectually prevent. Let us suppose, that I had been accustomed, from a consideration of its colour, to give to a carrion-crow the appellation of blackbird, while you gave the same appellation to the species of birds commonly fo called. The properties of the blackbird become the subject of conversation; I mention its disagreeable

qualities and hoarfe voice: you aver it to be one of the most melodious of the vernal choir. I ridicule your affertion: you deny mine. We call each other's veracity in question; the dispute gets warm, till it is at length decided by some ingenious friend, who points out the origin of our mistake. Here, indeed, the dispute might at any time be settled by a reference to the object; but if, instead of the word blackbird, Religion, or Loyalty, or any other general term of equal importance, had become the subject of debate, it is plain, that while a shade of difference took place in the associations attached to it, we never could come to an agreement.

Befides an extensive acquaintance with the various affociations attached to the same word, it is necessary that an extensive knowledge of things should be acquired by the young person whom we wish to have prepared for exercising the speculative faculties to advantage.

Those

Those who enter upon general reasoning with a flock of ideas derived from few fources, will, notwithstanding the accuracy of the ideas they possess, be liable to many errors. Narrow as the fphere of for the grafp of human intelled; yet fo curioully interwoven are its various branches, fo dependent on each other are all its parts, without a comprehensive view of the whole. to young people in a variety of ways. It will be the best preservative against that vanity and prefumption, which a little learning is fo very apt to produce. It will likewise be a stimulus to the acquirement of ideas upon various subjects; and prevent the mind from over-rating the value of its own

What I have here advanced upon the necessity of acquiring a variety of ideas, may, upon a superficial view, appear in-

onfilten

confiftent with what I formerly faid upon the inutility of defultory reading. In the ideas I have expressed, there is, however, those trains of thought which are favourment we shall only, by augmenting the number of ideas, augment confusion. Those who possess but a scanty wardrobe, may cast the few things they have into an open drawer, where they will readily be found when occasion calls for them; but if all forts of things are stuffed without order into the fame place, in vain will you fearch for the fmaller and more delicate articles amid he cumbrous heap. Still, however, what you put into the drawer you will find in it. Not fo with what is put into the mind; unless its contents are fastened by the chain of affociation, they will either be entirely loft or ufelefs.

"Except some professed scholars," says Mr. Gibbon in a letter to a young lady, "I have often observed, that women in general read much more than men; but so for want of a plan, a method, a fixed object, their reading is of little benefit to themselves or others." The observation of method in reading, so far from being unfavourable to the acquirement of a variety of ideas, is essential to it; and is therefore worthy of our ferious attention.

The following illustration will ferve to place this subject in a clear point of view. Supposing your pupil to be acquainted with the general outlines of ancient and modern history, and that it is wished to give him or her a more particular knowledge of some one of the European states, the first books you would naturally confult are those which treat of its origin; you then have recourse to the authors who trace its progress through all the purifying consists it has sustained, from barbarism to resine-

fion of public events in the order in which they occurred, would be of little avail, if they had their fource. These are, the pasfions, the opinions, and the prejudices of the chief aftors on the given theatre. To have clear ideas concerning thefe, there must, in the first place, be an adequate knowledge of the human mind; and in the fecond, accurate conceptions of the views and affociations on which the opinions and prejudices described originated. Unless accurate ideas concerning thefe are obtained, the subject can never be thoroughly understood. Nor will a distinct conception of the moral causes of events be fufficient for our purpose; to these must be graphical and natural divitions, foil, climate, produce, &c. &c. must be known; or many of the events related will be unintelligible. Thus we fee, that to obtain a perfect knowledge of any one country or district of the globe, a variety of books on different subjects must necessarily be confulted. But while one object is kept in view, the ideas acquired, however various, will be fo arranged as to be always ufeful; and the greater the number of these ideas, the better will the mind be five views on every part of the subject. Whoever enters the field of knowledge with to arrive at it, by refolutely remaining blind to every other, will find that he has mistaken his path; while he who has no fixed object in view, will wander in an everlasting labyrinth of perplexity and confusion.

As no accurate idea can be formed of any object which is only seen in one point of view, it follows, that the opinions formed from such a partial knowledge, must ever be erroneous and superficial.

Observation

Observations upon the opinions and affor fituation and circumstances, is such an effential fource of ideas, that persons placed in circumstances which afford no opportunities for this species of observation, must, orderto make these observations effectually, the mind must be in full possession of the primary faculties; and to enable it to draw just inferences from them, it must be capable of generalization. To perfons thus qualified, that station in society which affords the most extensive views, is evidently the most advantageous. The higher and the lower walks of life are, in this point of view, attended with equal inconvenience; while those who are placed on that happy isthmus in fociety, from which they can occasionally make excursions into either of the neighbouring countries, are alone bleft with the opportunity of making just observations on the inhabitants of both. They fee the confined views of every little circle; they contemplate the effects of those various affociations which characterize each separate class; and appreciating the value of their pursuits and enjoyments according to the standard of reason, rejoice in the goodness of the Great Creator, who, while he implanted the desire of happiness in the human breast, taught imagination to seek for it in such a variety of objects.

Before your pupils enter upon speculative enquiry, it is above all things effential, that their judgment should be exercised in ascertaining the limits of humanknowledge. All speculations concerning what is placed beyond the reach of the human faculties, ought to be avoided; for from them no possible advantage can be derived. They must ever end, as they begin, in uncertainty and doubt: but far from being a harmless waste of time, they frequently excite the violence of prejudice and animosity.

I shall conclude with some observations from Doctor Isaac Watts, of the truth of

which I am qualified to judge from observation, though not in all respects from experience. He advises the pupil to accustom himself to clear and distinct ideas, to evident propositions, to strong and convincing arguments. "Converse much," he continues, "with those friends, and those " books, and thoseparts of learning, where " you meet with the greatest clearness of " thought and force of reasoning. The " mathematical fciences, and particularly " arithmetic, geometry, and mechanics, " abound with these advantages: and if " there were nothing valuable in them for 66 the uses of human life, yet the very speer culative parts of this fort of learning. " are well worth our fludy; for by perpe-" tual examples, they teach us to conceive " with clearness; to connect our ideas in "a train of dependence; to reason with "frength and demonstration, and to dis-"tinguish between truth and falshood. "Something of these sciences should be « Andied

"fludied by every man who pretends to "learning, and that," as Mr. Locke expresses it, "not so make us mathematicians, as to make us reasonable creatures.

"The habit of conceiving clearly, of judging justly, and of reasoning well, is not to be attained merely by the hap"piness of constitution, the brightness of genius, or the best collection of logical precepts. A coherent thinker and a

"flrict reasoner is not to be made at once by a set of rules; any more than a good

"painter or musician may be formed extempore, by an excellent lecture on mu-

"fick or painting." This, like all our other habits must be formed by custom and practice. Adieu.

LETTER XIII.

REFLECTION.

Different Applications of the Term.—Sense in which it is at present used.—Advantages of Reflection.—Foundation of it to be laid in early Life.—Inutility of Reflection, when not exercised under the Influence of Religious Principle.—Rlustrations.—Conclusion.

You know, my dear Friend, that by Reflection, in the popular fense, nothing more is understood than a serious re-consideration of any subject which has engaged our attention. By metaphysicians, however, the term is applied in a stricter fense, to denote that power which the mind has of examining its own operations. Few persons of education are destitute of Reslection

Reflection in the former application; but if we strictly adhere to the latter meaning of the term, I am afraid, we shall find that the number of those who are capable of exercising it, is extremely limited.

The exercise of Reflection implies the possession of all the preceding faculties; and where any of these are defective, we need not expect that the mind will ever be brought to reflect upon its own operations: as to do fo effectually, is the highest and most useful exertion of the intellectual powers. If this exercise of intellect be wanting, it is not the knowledge of all the sciences, nor an acquaintance with all the branches of human learning, that will lead to true wifdom. For this great purpole, an accurate knowledge of one's own heart is more effential than all the learning in the world. Deceit is the great vice of fociety; but, I believe, few people practife fo much of it upon others as upon themfelves; nor is it possible, that felf-deceit can be avoided by any other means than the frequent exercise of Reslection.

Though Reflection is the last of the powers of the human mind in the order of appearance; yet, like all the other faculties, it will certainly fpring by a proper preparation of the foil. It was to pave the way for its production, that in treating of the cultivation of the heart, I fo strongly recommended a frequent appeal to the feelings in the conduct of children toward each other. By this they are early taught to bring things home to their own bosoms, and to see every part of their conduct in the light in which it is viewed by others. It is thus, that the feelings and affections of the heart may be made to affift and strengthen the opening judgment, instead of misleading and perverting it. It is thus, too, that the conceptions concerning the judgment of others upon our own conduct may best be improved. And wheneverthis preliminary step has been neglected, I believe I believe the cultivation of Reflection will become difficult, if not impossible.

Those who are least accustomed to reflect upon the operations of their own minds, will ever be found most forward to judge with feverity of others. Who are the evil speakers? Who are the retailers of petty scandal? Are they not those who never cast a thought on the motives by which they themselves are governed? The knowledge of one's own mind will ever bring fuch a fense of the impersection of its various faculties, and of the impositions to which they have been liable, from the influence of paffion and prejudice, that this falutary exercise of the power of reflection, pride and felfishness oppose such infurmountable obstacles, that wherever they predominate, it can never be expected to take place. By Him who "knew " what was in Man," and whose doctrines tend to bring all his various powers and

faculties to the highest perfection of which they are fusceptible, pride and felfishness were therefore condemned in all their branches; and in order to destroy their nation (which is nothing but a mode of exercifing the power of reflection) was enjoined as an effential duty. Here we have another striking instance of the consonance of the institutions of the Gospel with the first principles of the philosophy of the human mind. It is by this felf-examination that we are commanded to prepare ourselves for the most solemn ceremony of our religion; by it alone we can come at a knowledge of the governing motives of our conduct, which on that folemn occasion we are to try by no capricious standard. Love to Gon, and unconditional benevolence to man, with all their correfpondent defires and affections, are the unerring rules by which we are to judge of the state of our hearts, and the complexion of our actions. On this account I cannot but confider the frequent repetition of the duty above alluded to, as a most efficacious means of cultivating the power of reslection, and of rendering the exercise of it habitual.*

I well know, that by making Religion the basis of my theory, I shall expose my-felf to the derision of some minds, and the contempt of others: as all that I have advanced will, by certain persons, be attributed to the prejudices of education. I can, however, aver, that they are not its unexamined prejudices; and that if I still adhere to the old-sashioned principles in which I was brought up, it is not without

^{*} How little the forms of confellion, which are often put into the hands of young people upon this occasion, are calculated to answer the end proposed, must be obvious to every thinking mind. If instead of seeking to discover the hidden springs and sources of their own actions, and judging of them as they appear in the sight of Gon, they are taught to pronounce themselves guilty of all manner of fins in the lamp, the heart will be little benefited by this religious duty.

a liberal

[411]

a liberal and candid examination of those which others have embraced.

When I first began seriously to contemplate the operations of the human mind, I was far from being fully aware of the intimate connection which sublisted betwixt these and the Divine commandments; nor had it ever occurred to me how very eminently the one was adapted to the other. In vain did I endeavour to find in any other fystem a perfect conformity with the human character, in all its various modifications. Other fystems applied to particulars, that of the Gospel alone I found to be of univerfal application; and when, with this view, I examined its contents, I in vain endeavoured to find one paffage the spirit of which was not in unifon with the theory of the human heart.

When the intellectual faculties became the subject of investigation, I found, and confess I delighted in finding, that so far frem being inimical to their highest cultivation, vation, the facred volume afforded the greatest assistance; while its doctrines held forth the most animating encouragement to the improvement of all the mental powers. Nor ought I to conceal, that the examination of the principles of the human mind gave, on the other hand, strength to my faith, and confirmation to my belief in the Divine origin of the facred oracles. (1)

I hope that after this candid declaration, none will accuse me of prejudice, till they have thoroughly examined the tenour and tendency of the principles I have avowedly adopted; as if they decline this task, I think I am at full liberty to retort the charge of prejudice on them.

Let us now fee, how far the advantage to be derived from the exercise of Reflection is increased or diminished by religious principle.

I prefume it will on all hands be admitted, that whatever tends to augment the benevolent affections, and to deflroy the influence influence of the malevolent passions, has likewife a tendency to increase the happiness of the individual and of society. When a person, whose notions of moral obligation are founded on the felfish principle, takes a view of the operations of his own mind, and perceives the unworthiness of the motives by which his best actions have been fometimes influenced; when he is made fenfible of the errors of his judgment, and the fallacy of his reason; what is the refult? Instead of humbling himself before the Searcher of hearts, and imploring the Divine affiftance, he looks round upon the world, and in the follies and the crimes of others, finds excuse and consolation. A fense of his own weakness diminishes not the force of pride, or abates the arrogance of prefumption. If obliged to confess that some appear to act more wifely or more virtuously than himself, it is to superior cunning, or superior good-fortune, that he attributes the difference. The knowledge of his own motives produces suspicion with regard to the motives of others. The consciousness of his own erroneous judgment begets scepticism with regard to their opinions. These feelings and affociations are not of a nature to inspire benevolence; they are, on the contrary, intimately allied to all the malignant and diffocial passions.

Very different is the improvement that will be made by the man of religious principle, from the confcientious exercife of the power of reflection. A fense of the many instances in which he has been influenced by those passions which it has been his endeavour to subdue, will beget contrition and humility: conscious that his actions are known to the world, while his contrition and repentance are unknown to all, save God and his own heart, he will naturally suppose it to be the same with others, and will, accordingly, be inclined to pity rather than to censure. The difficulty he finds in keeping his good resource.

lutions, and in acting up to the calm decifions of enlightened judgment, will lead him to reverence and efteem those whose conduct evinces a greater degree of energy and confiftency; while, at the fame time, it will render him careful of attributing bad motives to all who are guilty of improper conduct. In tracing the fource of his erroneous judgments, he will discover fo many affociations originating in circumstances over which he had little or no control, that he will view the prejudices of others with as much candour as he confiders their actions. Never will the person who is capable of the exercise of philosophical reflection, prefume to take the prerogative of judgment from the Most High: never will he arrogantly decide upon the acceptance or reprobation of a fellow mortal, on account of the speculative opinions he may have embraced. Every emotion excited, every affection produced, by ferious reflection, are, (while reflection

reflection is exercifed under the impression of religious principle) of the benevolent class. Humility, dissidence, earnest desire of Divine assistance, hope towards God for suture aid from a sense of former mercies, and love and gratitude springing from the same source, are each allied to benevolence. Wherever devotion produces affections of an opposite tendency, there, we may assure ourselves, reslection has been uncultivated.

In exact proportion as the power of reflection is enjoyed, shall we reap advantage from the cultivation of every other faculty. If incapable of applying our judgments respecting right or wrong to ourselves, we shall not be much the better for their accuracy. If we cultivate imagination so as to produce the most brilliant combinations, and are without the power of reslecting on their tendency, and from an examination of our own heart, discovering the emotions and dispositions which produced them; we may amuse ourselves by wandering in the flowery fields of fancy, but will never gather any of its precious fruits.

Without the exercise of reflection, the faculty of abstraction is a dangerous gift. If we are incapable of referring to our own consciousness for the truth of those we shall be liable to be imposed upon by fophistry; and be destitute of means to detect the imposition. Even in the cultivation of TASTE, it is impossible to proceed to any length without the exercise of reflection. Those who are destitute of this power never can be made to comprehend the principles upon which tafte is founded. They, therefore, fuppose the emotions of fublimity and beauty to be derived from fome inherent inflinct, as natural and as univerfal as that which affifts us in diffinguishing sweet from bitter. Nor without reflection upon the operations of their own minds, is it possible that they should see it in a different light.

As

As a still farther argument in favour of the cultivation of this power, it may, with propriety, be remarked, that without the affiftance of reflection, we shall neither have "manners void of offence towards all men;" nor will any appear to have manners void of offence towards us. Perfons who are accustomed to take circumscribed and narrow views upon every fubject but their own importance, confider every aberration from the line of conduct they prescribe, as an intended infult or manifest impropriety. They consider that as difrespect, with which no idea of difrespect was affociated in the mind of the offending party. They construe thoughtlessness into infolence; and neither make allowance for the levity of youth, nor the infirmity of age. Whatever is faid of them one note below the key of panegyric, is fo offenfive as to be deemed unpardonable. The friend who points out an error, is accused of hatred and malignity. And here it may be observed, that to those those who never examine their own hearts, the imputation of blame must necessarily be intolerable, because they know not how far it may be just or unjust; and willing to impose upon themselves, they revolt at the idea of being scrutinized by others. Hence the heart-burnings, jealousies, and strifes, which are, alas! so prevalent in the world.

Let us fee how far the evils above-mentioned would be remedied or removed, by a more general exercise of the power of reflection.

When we reflect upon our notions of propriety or impropriety with respect to manners, we find them entirely dependent on affociation. In members of the same society, the same affociations will doubtless take place, though modified by the disposition and character of individuals. For this modification the person of reflection makes allowance, from the conviction that, from thronger afsociations of propriety attached to certain forms, some lay a greater

ftress upon them than he does; he therefore concludes, that what he deems effertial, others may confider as indifferent.
Conscious that his own omissions are void
of pride, insolence, or malignity, he confiders the omissions of others as equally
blameless: or if he at any time perceive
his feelings hurt by neglect, or wounded
by improper treatment, instead of indulging in the bitterness of wrath, he takes a
ferious retrospect of his own actions, and
feverely scrutinizes his own conduct, lest
he too should be guilty of inslicting a wound
in the bosom of the innocent.

With regard to the judgments of the world, or of individuals, it is only the perfon of reflection that can be superior to their influence. Without such a perfect knowledge of ourselves as enables us to appreciate with truth and precision the strength of our faculties, and the merit of our conduct, we shall be liable to be elated with flattery on the one hand, or depressed

by cenfure on the other. By reflection, and by reflection alone, can this knowledge of our felves ever be attained.

"When felf-esteem, or others' adulation,

"Would cunningly perfuade us we were fomething

"Above the common level of our kind,

"Tis this gainfays the finooth-complexion'd flattery,
"And with blunt truth acquaints us what we are."*

Nor is a just acquaintance with ourselves less necessary to prevent dejection when popular favour takes slight. Severely must those, who have no other measure of their own worth but popular opinion, seed the loss of that public applause on which they rested. The person, on the contrary, who, under the impression of religious principle, has exercised philosophical restection, will be alike superior to popular applause or popular condemnation. He will make use of both as means of further improvement in virtue. Conscious that in the former case his merits have, in many instances, been over-rated, the conscious-

nefs will increase humility. And where his actions are mifrepresented by calumny, or mistaken by prejudice, he will rejoice that it is to mistake and misrepresentation, and not to truth, that he owes his present loss of favour. Or if, on a scrutiny of his motives, he does not find them blameless, far from feeling malignity towards those who have anticipated him in the discovery, he will acknowledge his error, and thus have an opportunity of exercising some of the noblest and most heroic of the human virtues.

Thus, my Friend, it appears, that in all the circumstances and fituations in which an intelligent being can be placed, Reslection is essential towards the perfection of the human character. Those who are aware of the consequences attending its cultivation, will find abundant opportunities for laying the foundation of it in the minds of their pupils. Every observation on the actions of others, on the ways of Providence, or the events

of human life, may be rendered fubfervient to the cultivation of reflection, by the care of a judicious instructor. If the advantages refulting from reflection be kept perpetually in view, pains will be taken, even from the earliest period of life, to remove all obstacles that might impede its progress. What these obstacles are, I have, in the Letters on the Cultivation of the Heart, attempted to delineate. By their removal the path will be left open; but without the affiduous cultivation of all the intellectual faculties, it will never be trod. By destroying pride, felf-will, arrogance, and all the diffocial and malevolent paffions, and introducing affociations favourable to benevolence, we render the disposition amiable; but let us remember, that to be amiable is not to be virtuous. Virtue confilts in the right direction that is given not only to the affections of the heart, but to the powers of the mind. It is not of a negative, but of a politive nature. It implies the proper employment not only of the moral but of the intellectual powers. These the wildom of the Great Creator has ordained to a mutual dependence on each other, fo that neither can be in any cenfiderable degree improved, while the other is neglected. Where the feelings of benevolence are unknown, the exertions of the understanding will be circumscribed by felfishness within narrow limits; and where the impulses of the benevolent heart are not controlled and directed by judgment, they will be productive of only partial good, and may eventually lead to extensive misery. Confidering it as one of the chief advantages refulting from the exercise of philosophical reflection, that it enables us to attain a more perfect knowledge of the motives which govern our actions, I shall beg leave to offer such hints with regard to this species of felf-examination, as may be found of use to those who are desirous of entering on the difficult but, important As

[495]

As the passions and affections are the active principles of the human mind, it is to their influence that upon a firich fcrutiny we shall trace the motives of our conduct. This influence is frequently so imperceptible as to escape our observation. In order to penetrate it, it is not fufficient that we frequently review the tenour of our actions, and accurately examine the propriety of our fentiments; for not by reflection upon these alone can we become thoroughly acquainted with the dispositions of our hearts. The flave of felfishness and pride may occasionally perform generous and noble actions, and just and fublime fentiments may be formed by the understanding, while the desires are impure and the passions malevolent; but in no instance will the trains of thought which perpetually pass through the mind, be untinged by the predominant affection. To the nature of these, then, we are to direct our strict research. When busied

in active employments, occupied by study. or engaged in the intercourses of society, our thoughts must necessarily be directed into various channels. But let us enquire what is their natural course in the stillness of folitude? What the complexion of the first-fruits of that renewed existence which we experience every fucceeding morning? If our affections are influenced by love to God and good-will to man, shall not the lifting-up of our hearts be as the morning facrifice? If, on the contrary, the trains of thought which first begin to flow, are connected with ideas of our own comparative excellence, while plans for our own exaltation and the degradation of others fpontaneously prefent themselves, we may be affured that pride and vanity are the main-fprings of all our actions. As the strength of memory depends much upon the strength of the impression, I would not have the person consider himself in a fafe or healthful state of mind, whose first thoughts

thoughts presented all the circumstances of a former injury; nor let the consciousness of many infirmities sink the person into despair, who, in shaking off the chains of sleep, feels the joyful sense of gratitude to his Great Creator; and whose first impulse leads to the consideration of means for promoting the happiness of his fellow creatures. By thus reslecting upon the nature of the thoughts which spontaneously occur, we shall be enabled to lift that veil of self-deceit which conceals from our view the operations of our own hearts.

Before I conclude this my last Letter, I would make it my earnest request, that every one to whom the subject is interesting, may take pains to enquire and to examine into the truth of those principles which I have adopted, and which appear to me to be the only solid basis upon which education can be founded.

As the theory I have endeavoured to effablish, with regard to the necessity of cultivating

cultivating the various mental faculties in the order in which nature produced them in the human mind, and of laying the foundation of their cultivation in watching over the affociations which affect the defires and affections of the heart, muft, if generally received, tend to produce a ferious alteration in the plan of modern education; I am prepared for the opposition by which it will probably be encountered.

Some, with that tone of false humility which contented ignorance, when united with pride, never fails to assume, will, perhaps, object to it as too perfect. "We don't want to make philosophers of our children," fay these good ladies; "and as for intellectual faculties and such stuff, we know nothing about it, and are never a bit the worse. Our children are not more spoiled, or less taken care of, than the children of other people; and must just take their chance as the children of other people do. If we fend them to

" genteel fchools that are well established, we do our duty."

Such arguments admit of no reply. But I am aware that objections may come from perfons of a fuperior defeription, who having fet their hearts upon feeing their children excel in certain accomplishments, may be unwilling to be convinced, that they have not only over-rated the value of these acquirements, but have mistaken the road to excellence, even with regard to the objects in question.

In difcuffing the fubject of Tafle, I endeavoured, by fuch a flight inveftigation of its principles as my limits would admit, to fhew the impossibility of producing excellence in the fine arts without the cultivation of the previous faculties. The famereasoning may be applied, with some modification, to all the sciences, and to every branch of human knowledge. By much pains and incessant application you may make your child a linguist at an early age;

you make likewise make him an historian, a botanist, a mineralogist, or what else you please: that is to say, you may, by means of perception, the only faculty that is then ripe, impress his memory with the words and terms belonging to these several branches of science and literature. Satisfied with his progress, you delight in finding his attention absorbed in these pursuits, and fondly expect that when he arrives at maturity, he will give such proofs of superiority as shall at once enlighten and assorbed the world.

Beware, I befeech you, beware of encouraging hopes which must infallibly end in disappointment! If at that period when the conceptions ought to have been invigorated by attention to furrounding objects, attention has been occupied elsewhere, the conceptions will become habitually weak and languid. And if by early and incessant application you have destroyed that vivacity which is by nature intended

to be instrumental in increasing the flow of ideas in the youthful mind, the conceptions will not only be languid, but the ideas will be few. From languid conceptions and a fmall number of ideas, what hopes can be entertained of the improvement of judgment? Your pupil has been busied in learning the refult of other people's judgment, but how is he to decide on their truth or falsehood, if he has never been taught to exercife his own? When a perfon fo educated arrives at maturity, he may be of use to others as a fort of walking dictionary, an animated encyclopædia; but he will neither illumine the world by the bright fire of genius, nor stop the progress of vice by the energy of exalted virtue.

Reflection, which in its operation requires feriousness, is wifely ordained by nature to be the last power that unfolds itself in the human mind. Nor does it begin to operate till the ideas are numerous, and the judgment strong. Where these preliminaries

preliminaries are enjoyed, reflection will not be found inimical to cheerfulness. It is the flow fuccession of ideas which produces low-spirited listlessness; and the that produces melancholy. But where fuch a perfect command has been obtained over the power of attention, as to render the mind for ever alive to the paffing scene, the ideas must necessarily be too numerous, and have too much variety, to admit of either of these consequences. Where the languid and the absent see nought but a joyless blank, the active mind finds sources of improvement and delight. The former lives as on a defert island, where he depends on foreign supplies for his existence. The latter extracts from the furrounding feene an ample flore of nourishment; nor does the continual fealt which nature foreads for the light heart and the ardent imagination, pass unenjoyed; while habits of philosophical arrangement and reflection

render his pleasures not only harmless but wholesome.

If the sketch I have endeavoured to give of the human mind, be drawn from truth and nature, the abfurdity of attempting its partial cultivation by an inversion of nature's laws will be an obvious inference. According to the plan which my feeble hand has attempted to delineate, it appears that the vital parts of the corporeal frame are not more intimately connected, or more effentially dependent on each other, than the active and intellectual powers of the mind: and that as the muscular strength of a single limb does not constitute bodily health or vigour; fo neither does the capability of exerting a fingle faculty, in however eminent a degree, give any title to mental fuperiority.

In prescribing for the diseases of infancy, he must be a bad physician who did not extend his views to the probable consequences of his prescriptions on his patient's

VOL. II. FF

future health; how much more blameworthy the person, who, in giving advice with regard to the human mind, limited the consideration of consequences to the contracted span of the present life!

My views will, I truft, be found to be more exensive; they embrace a wider portion of existence. May those who adopt them, find, to their bleffed experience, that they lead to the path of elory, honour, and immortality! Adieu.

ADDITIONAL

NOTES AND OBSERVATIONS

TO THE

SECOND VOLUME.

(B.) p. 38.

THE want of veracity, so justify and so often complained of, is always attributed to want of principle: but that it does not always proceed from an inclination to deceive, I have had frequent opportunities of observing. An instance which now occurs to my recollection, will serve as an example. It happened that the son of a neighbour of mine in the country had the missortune to be bitten by a dog which belonged to a decent tradesman in a neighbouring town. It was an object of much importance to ascertain whether the dog (who was killed

the moment after the accident) had shewn any fymptoms of hydrophobia previous to that event. The fervants and workmen belonging to the honse were separately examined upon the subject; but to no purpose, as no two of them agreed in any one point. Here no one had an interest to deceive, but, on the contrary, all were equally anxious to recollect the truth: yet so contradictory was their testimony with regard to the events of the day before, that it is highly probable the exact truth was told by none.

In Fielding's voyage to Lifbon, a circumfiance fomewhat fimilar to the above is related; and I make no doubt that occurrences of the fame nature are in the recollection of many of my readers. Every fuch example, if inveffigated with accuracy and candour, will ferve to confirm the truth of my theory respecting the fatal consequences arising from neglecting the early cultivation of the faculties of Attention and Conception.

(c.) p. 68.

In the long and painful illneffes with which I have been afflicted, I have had it in my power to make observations upon the effects of

attention, which may have escaped far more penetrating and reflecting minds. That a violent fit of pain commonly absorbs the whole attention, every one who has had any experience in that way, will readily confess; but if we are at all able to reflect upon the operation of our minds, during the feelings of extreme pain, we shall be convinced, that the attention we bestow upon the pain, increases our perceptions even of the fainter fenfations to fuch a degree, as to render us infensible of the moment when the acuteness of pain begins to fubfide; fo that (especially if we indulge in fretful or grievous lamentations) the pain must have been very confiderably diminished, before we are willing to acknowledge, or are indeed confcious of, its having been at all relieved.

By this it appears that attention prolongs the apparent existence of pain; and it follows as a necessary consequence, that where attention is called to another object, (as in the case of expected relief from some powerful agent) the minuter sensations will pass unnoticed; and the cure be allowed to be effected from the moment that the pain had actually subsided. The slighter complaints to which delicate con-

fittutions and enfeebled minds are particularly fubject, obey those laws of attention in a remarkable manner. To a selfish attention to every flight sensation of uneasiness, they (many of them at least) owe their very existence: and no sooner is the attention called to other objects, than they immediately disappear.

- "Limera's fick make hafte, the Dodor call-
- 45 He comes, but where's his patient?-At the Ball!
- "The Doctor stares: her woman curtieys low,
- " And cries, My Lady, fir, is always fo, "Diversions put ber malady to flight."

Does it not evidently follow, that to give the mind a command over the faculty of attention, is to leffen not only the moral evils of life, but to thorten the duration of the physical? That it can preserve the mind from the affault of ideal misery, would be sufficient argument for

enforcing the cultivation of a power fo precious; but when we confider it as abridging the period of real fuffering; when we reflect that, by this command over attention, we refue a confiderable portion of our existence from the dominion of evil, and restore to the mental powers that activity of which an attention to

L 439]

pain had deprived them; its advantages appear in ftill more firiking light.

(D.) p. 150.

As a proof that the memory of Perception may be enjoyed in high perfection, where all the other faculties are defective, I shall beg leave to adduce the following instance, which I had in very early life from a venerable friend, who was then advanced in years, and had in youth been witness of the fact :- An ideot so utterly destitute of the faculty of conception as never to be capable of acquiring the use of speech, (though it did not appear that his organs, either of speech or hearing, were at all defective) was for a great number of years confined to an apartment, where he was occasionally visited by his family and their friends. In this apartment flood a clock, to the firiking of which he evidently appeared very attentive, and it was the only fign of attention which he ever displayed. Every time the clock struck, he made a clucking noise with his tongue, imitative of the found; and this he continued to do as often as the hour returned. After ftanding many years in the room with him, the clock was removed;

when, to the surprise of all, he continued as the hour came, to make exactly the same noise as he had learned to do from it. He was perfectly exact in the calculation of the time, and never missed an hour in the day or in the night: nor did he ever cluck one too many or one too few; but continued to the hour of his death to give the exact notice of the lapse of time, without missake or variation.

It was with confiderable uneafinefs I learned from feveral of my friends, that the above particulars were thought by fome to be no other than a ftory manufactured from the old anecdote given in Plott's History of Staffordshire, and copied from it into the Spectator. The name of the late Mr. Wilfone, of Murray'shall, by whom I heard the fact related, would, to all who were acquainted with his character, have been fufficient evidence of its truth. But with regard to what I had heard in childhood, it was possible that I might myfelf be mistaken. The doubt was painful: for though my friends would only have attributed the fault to memory, those who knew me not, might call my veracity in question. Anxious to ascertain a point in which I confidered myfelf fo deeply interested, I

hastened to make enquiry, and with inexpressible fatisfaction received the affurance that I had been perfectly correct in my statement with regard to every particular, excepting that the clock, instead of being removed from the room, did not ftrike from being out of repair; and that it was this circumstance of the boy's continuing regularly to mark the hours while the clock was not going, that drew the attention of the neighbourhood. The ideot lived at Culrofs, on the river Forth, in Scotland, where my venerable friend, Mr. Wilfone, likewise resided in early life. The following letter, which I have just received from one of that gentleman's daughters, corroborates all the above-mentioned circumstances, and I shall therefore trust to her

" DEAR MADAM,

"No words can express my vexation, when informed that ---- had neglected to deliver the letter I did myself the honour of writing you in the beginning of February; in which I informed you, that both my fifters perfectly and distinctly recollect to have heard my father often speak of the ideot "vou

"you mention in your valuable book on edu"cation; and his fifters, who were older than
him, used to mention more minute particulars, such as the chair where the boy sat
being opposite to the clock, &c.; and they
were often in the house.

"My fifters remember to have heard my aunt Janet speak of this ideot, and of its exactly imitating the clock, though then not going, (which was the only thing made them all speak of it) with a Mr. David Robifon, uncle to Colonel Robifon, of Fawrs, who also lived in the neighbourhood, and knew all these circumstances perfectly well."

"I am extremely forry to have fent my letter by any conveyance but the poft, and am grieved that this is fo much later than it it ought to have been.

"Your very humble fervant,

" Murray's-hall, 5th April, 1803."

(E.) p. 273.

Did, a doubt remain concerning the utility of providing instruction for the poor; that doubt must give place to conviction, even in the minds of the prejudiced, on contemplating the two opposite portraits drawn of the pealantry of Scotland, at the diftance of little more than a century, by two diftinguished writers, whose sketches are equally entitled to the praise of truth and accuracy. The first presents such a picture of poverty and profligacy, idlenefs and elufion of the enlightened author," who faw the authority of one who united the virtues of the patriot to the talents of the statesman and the wifdom of the philosopher, and whole local knowledge of the fubject leaves us no room to suspect him of inaccuracy or misrepresentation. By the establishment of parish-schools, this deplorable portrait of vice and mifery has been fo happily and to completely reverfed, that

did it not stand upon such unquestionable authority as an original, it might well be confidered as false or spurious. Let it be compared with the account of the Scottish peasantry, drawn by the mafterly hand of the elegant and accomplished biographer of Robert Burns. Never were local manners more happily delineated: never were the effects of local circumflances more justly displayed. As it is a subthould not do justice to a work from which I have received fuch pleafore and inftruction, if "character and condition of the Scottish " peafantry," I have in vain endeavoured to which a fingle century has produced on national character, Doctor Currie has not, residence, which the subject may seem to merit. Whoever has been prefent at the performance

of the Baptifinal ceremony at a country Kirk, and observed the earnestness with which the moral and religious education of the child was enforced upon the parents; making a material part of that vow which they were then in the face of the congregation folemuly to take, cannot wonder at the zeal displayed by the lower orders in Scotland with regard to the education of their offspring. In the life of Burns, this paternal zeal is beautifully described: In the letter from his brother Gilbert to the Editor, its effects are powerfully illustrated.

(F.) p. 327.

I with I could prevail on accomplished young ladies to confider the effect that would be produced by the exertion of their mufical talents in places of public worthip. Why flould Church be the only place in which they are athamed to let their voices be heard? Is it, that they think none thould join in the praise of God, but fuch as are paid for it? Is it the theme that is unworthy of their talents, or the place that is unfit for their exertion; or is the audience too mean to be indulged with hear-

(G.) p. 337.

If the principles of take be fuch as they are here described; if fitness and congruity be constituents in their essence; it is to be feared that the leaders of the beau monde are not yet many steps removed from barbarism.

The falle notions that have been entertained concerning Tafte, have in many respects been injurious to society. By rendering the subject contemptible in the minds of the serious, they have prevented that investigation of its prin-

ciples which would have brought them into general notice, and rendered their application univerfal. It is from the want of this inveltigation, that Tafte has been confidered as altogether unconnected with the subject of morals, though a very little reflection would be fufficient to point out their affinity. True take would affociate ideas of efteem and respect to all those qualities which are estimable and respectable; from the neglect of its cultivation many of these qualities are held in contempt. What are the affociations which evidently prevail in the minds of the young and the gay, with respect to the virtues of modelty, prudence, and temperance? Does it not obviously appear that ideas of glory are often attached to qualities directly opposite: and that such drefs and manners are adopted as may beft fhew the strength of this affociation in the most glaring colours? To the eye of Tafte each does the venerable oak, when fringed with the hoary ornaments of winter, afford a prospect less various or delightful, than when decked in the most luxuriant foliage. Is, then, the winter of life connected with no affociations but those of horror?

horror? This can never be the case, until ideas of contempt are affociated with ideas of wifdom and experience; affociations which the cultivation of true tafte would effectually prevent. Suppose the person who wishes to improve on Nature's plan, should apply to the artificial florift to deck the bare boughs of his fpreading oak with ever-blooming rofes; would it not be foon difcovered, that in deferting Nature he had deferted Tafte? It would be remembered, that the colouring of Nature, whether in the animate or inanimate creation, never fails to harmonize with the object : that her most beautiful hues are often transient, and excite a more lively emotion from that very circumstance. I leave the application to your own fagacity; and should fincerely rejoice, that the observations I have made, would lead to an examination of the principles on which they have been founded.

(H.) p. 385.

The Author of these Letters has, in a former publication, endeavoured to expose the consequences of this exercise of the united powers of abstraction and imagination, where judgment has been uncultivated. She is, however,

apprehensive, that many who have been amused with the fiction which the at that time made the vehicle of her fentiments, have failed in drawing the inferences from it, which it was her wish to have rendered obvious. The observations the has had an opportunity of making upon this head, have furnished her with new arguments concerning the utility of abstraction, and the fatal confequences arising from the incapacity for generalization. Those who are incapable of general reafoning, think it impolfible to draw genuine pictures of human character but from particulars. They are, therefore, for ever hunting after the originals from which fuch pictures must, in their opinion, have inevitably been drawn; and thus they lose the advantage that might have been derived from making proper inferences; while all their ideas of what is just and natural, being drawn from the fame confined and narrow fource, their criticisms are equally unjust and imperfect.

(I.) p. 412

The flow progress of the human mind, in attaining abstract ideas, appears to me as an irrefragable proof, that the notions of the VOL, 11. G G Divinity

Divinity obtained in the earliest ages by the Hebrew patriarchs could only have proceeded from Divine revelation. Without fuch revelation, the abstract ideas of the DEITY that are to be found in the writings of Mofes and the prophets are entirely unaccountable, and far more miraculous, that is to fay, much farther removed from the common course of events, than any of those miracles which have been flumbling-blocks to the fceptics. Let us fludy the tenour of our Saviour's addresses to the Jewish nation, and we shall find how strongly he reproaches them for having exchanged the pure and abstract notions of the Divine attributes for the low and groveling conceptions originating in the fenfes. All the discourses of our bleffed Lord have a tendency to lead the mind to form pure, i. e. abstract ideas of virtue. Conforming himself to the capacities objects, but never fails to carry the mind beyond the narrow conceptions of the fenfes

Of all the books that ever have been written, we shall find the Bible the most favourable to the improvement of the faculty of abstraction-

Experience

Experience proves the truth of the affertion. In countries where the knowledge of the Bible is denied to the laity, the conceptions of the DEITY become mean and degrading. Unfupported by the abstract ideas of his glorious attributes and perfections which the Bible furnishes, the mind calls in the aid of fensible objects. Hence the worship of images and a thousand superfictions, which chain down the mind to the consideration of individuals, and by preventing the expansion of the faculties in general reasoning, retard the progressive improvement of the human race.

Philosophy itself, when it proudly resuses Divine assistance, sies on low and grovelling wing. Let us compare the conceptions of some of our celebrated naturalists concerning the origin of things, with the sublime ideas upon the same subject to be found in the book of Job and in the Psalms. The rester in second causes follows in his reasoning the method of the Indian, who, endeavouring to find somewhat whereon to rest the vast fabric of the world, supposes it upheld by an elephant, while the elephant is supported by a tortoise! The other from contemplating the abstract

ideas of infinite power, wildom, and goodnels exerted through infinite space, beholds the foliation of every difficulty in the agency of the Divine mind, and feuffble of the circumferited limits of the human intellect, confesses that the knowledge of many things is removed beyond its grasp. I may be thought, in what I have here advanced, to have stepped a little beyond my own proper sphere; but the bread that takes an interest in the happiness and improvement of the human race, will be apt to lose the confideration of its own insignificance in the more enlarged idea of being a part of the great whole.

PIMIN
