RURAL POPULATION, TOMPKINS AND SCHUYLER COUNTIES, NEW YORK, 1925

BRUCE L. MELVIN

THE STUDY

A full understanding of rural society is impossible without some knowledge of the composition of the population. Adequate data on the distribution of the rural population according to residence, sex and age, and occupation, are critically lacking. Without this information the student of rural society cannot interpret the rural changes that are now in process nor offer intelligent guidance for rural planning. An intimate relationship seems to exist between the population composition as respects sex and age, and the activities of the institutions and organizations, in any village. When severe conflict rages within a village preventing the development of a school, a church program, or other social activity, often it appears to be due to a high percentage of the inhabitants being above fifty years of age. Furthermore, a pertinent problem arises when we consider where the farming people of the next few decades will probably center their activities. Will they go to the village, the town, or the city? Other studies have indicated that youth is found on the farms and old age in the villages;¹ can these two blend in village activities? Also, it has been shown that a high percentage of the rural population live in unincorporated villages,² though the reports of the Federal Census give nothing that would indicate this fact.

These various considerations caused the inception of the project of which this publication is the report — that is, it was decided to select an area and study its rural population in detail. The area selected and studied consists of Tompkins and Schuyler Counties, New York. The particular objects as finally formulated, and of which the tables, graphs, and text in this bulletin present the findings, were to ascertain (a) the distribution of population according to residence in the incorporated villages, the unincorporated villages, and the open country, (b) sex and age composition, particularly as related to residence, (c) occupations of both sexes by residence, (d) size of families in the different residential groupings, and (e) the conditioning factors in particular types of sex and age distributions.

The census use of the term *rural population* is adhered to in this work; that is, rural population is considered as that population living outside incorporated places of 2500 inhabitants or more.³ A village is any place with a population of from 50 to 2500. A hamlet is a center with a population below 50. A town is a place with a population of from 2500 to

10,000. A city has a population of 10,000 or more. The classification of occupations follows the practice used in compiling the census.

The data were taken from the duplicate copies of the 1925 State Census of New York. These were obtained from the offices of the county clerks through the permission of the Secretary of State. The procedure followed in compiling the information for this bulletin was similar to that used in compiling the census: cards were punched, sorted, and run on a counting machine.

COUNTIES SELECTED FOR THE STUDY

The two counties selected for the study, Tompkins and Schuyler Counties, lie in the central southern part of New York (figure 1). Dairying and general farming provide the chief sources of income for the farmers. Much of the farm land has been in process of abandonment for at least four decades. This is particularly true for the hill regions, since the topographical characteristics of both counties are hills and valleys (figure 2).

The city of Ithaca, in Tompkins County, and the town of Watkins Glen, in Schuyler County, are the only two places that may be classed as not being rural. Ithaca is a city of 18,948 inhabitants, and Watkins Glen a town of 2919.⁴ The town of Watkins Glen is sufficiently close to the minimum for an urban-population center, for its population to be used for comparison near the end of this analysis. Taking the two counties together, we have a rural population of approximately 31,000 which is herewith classified and studied. The rural population of Tompkins County (20,611) is almost twice that of Schuyler County (10,537) (table 1).

TABLE 1. CITY, TOWN, AND RURAL POPULATION FOR TOMPKINS AND SCHUYLER COUNTIES

Tompkins County		Schuyler County	
Total population.....	39,559	Total population.....	13,456
Population of Ithaca.....	18,948	Population of Watkins Glen...	2,919
Rural population.....	20,611	Rural population.....	10,537

Since Schuyler County is almost entirely rural and the rural population in Tompkins County forms more than 50 per cent of the total population, the assumption is made by the author that these two counties have a rural population fairly typical of the dairy and general-farming sections of New York.

GENERAL CHARACTER OF THE VILLAGES

There are both incorporated and unincorporated villages in these two counties. Tompkins County has five incorporated and fifteen unincorporated villages, and one hamlet; and Schuyler County has three incorporated villages, thirteen unincorporated villages, and three hamlets. The population of the hamlets is placed with that of the open country.

⁴ These figures are according to the State Census of 1925.

FIGURE I. THE COUNTIES STUDIED

FIGURE 2. CHIEF PHYSIOGRAPHIC FEATURES OF TOMPKINS AND SCHUYLER COUNTIES
The numbers indicate the elevation of the highest hills

The villages are industrial or agricultural centers, or city satellites. In Tompkins County, the villages of Groton, Myers, and Portland Point are industrial, as is Montour Falls in Schuyler County. Groton is the home of the Corona typewriter, Myers is largely built around a salt plant, and Portland Point is built around the Portland Cement Company. The chief industry of Montour Falls is the Shepard's Electric Crane and Hoist Company, which makes of the village a manufacturing rather than a farming center. The satellite villages are Cayuga Heights and Forest Home, both contiguous to Ithaca. The other villages in both counties are largely agricultural, depending for their existence upon the surrounding open-country population (figure 1).

INSTITUTIONS

In classifying the population, that part which is in institutions is separated from the remaining population in the civil units where these institutions are located, thus not following the practice of the Federal Census. The institutions and their populations are: in Tompkins County, the county farm (63), the George Junior Republic (134), the Odd Fellows' Home (61), and the tuberculosis sanitarium (29); in Schuyler County, Cook's Academy (92). The county farm, the Odd Fellows' Home, and the tuberculosis sanitarium are located in the open country, and the George Junior Republic is in the village of Freeville. Cook's Academy is in Montour Falls. The population of the institutions is separated from that of the open country and of the villages in the tabulations on the following pages. Though the census lists the population of Montour Falls as 1561, in the analysis of its population in this study it is regarded as having only 1469, the population in Cook's Academy being subtracted from the census figure. The same procedure is followed for Freeville, in which the population of the George Junior Republic is included in the census enumeration.

METHOD OF PRESENTING DATA

The data are presented both in tabular and in graphic form. As a general rule, the total for both counties is given and discussed first. If particular variations from the total for both counties exist in the make-up of the population of either county, attention is called to that fact. Furthermore, the general character of the incorporated villages, the unincorporated villages, and the open country, respectively, is discussed for both counties, and this is followed by special considerations for variations from the average for any particular groups.

THE RURAL POPULATION

The discussion from this point forward focuses on various detailed aspects of the rural population. This particular section is devoted to (a) a separation of the rural population into its classes according to residence, (b) a division of the open-country population into farming and non-farming, (c) a consideration of the density of the rural population, including a differentiation of those in the open country according to

FIGURE 3. PERCENTAGE DISTRIBUTION OF DIFFERENT CLASSES OF RURAL POPULATION ACCORDING TO RESIDENCE

whether they are farming or not farming, and (d) a distribution of the native- and the foreign-born in certain localities.

DISTRIBUTION BY RESIDENCE

Four classes compose the rural population when a division is made according to residence. These classes according to places of residence are: (1) those living in incorporated villages; (2) those living in unincorporated villages; (3) those living in the open country; and (4) those in institutions.

Approximately 60 per cent (60.7) of the rural population in the two counties live in the open country; the second largest contingent (23 per cent) are living in the incorporated villages; while the third group in point of size (15 per cent) is that composed of persons living in the unincorporated villages. The institutional population is very small in relation to the total, amounting to only 1.2 per cent. (Table 3 and figure 3.)

The percentage distribution of the population in the incorporated villages, the unincorporated villages, and the open country, varies somewhat for the two counties. This is easily discernible by reference to figure 3. Almost one-fourth of the total population are in incorporated villages in Tompkins County, while slightly more than one-fifth belong to this residential group in Schuyler County. A larger proportion (17 per cent) of the total population live in unincorporated villages in Schuyler County than in Tompkins (14 per cent).

THE OPEN-COUNTRY POPULATION

The open-country population is no longer a purely farming class. In both counties, 31 per cent of the population belong to the non-farming class (table 4 and figure 4). The percentage of the open-country population that the non-farming class constitutes, varies considerably for the two counties, being 35.3 for Tompkins and 22.8 for Schuyler. This higher percentage for Tompkins County reflects the influence of the city of Ithaca. People are working in the city but are living in the open country.

TABLE 3. DISTRIBUTION OF RURAL POPULATION IN INCORPORATED VILLAGES, UNINCORPORATED VILLAGES, INSTITUTIONS, AND OPEN COUNTRY

Both counties

Tompkins County

Schuyler County

FIGURE 4. DISTRIBUTION OF OPEN-COUNTRY POPULATION BETWEEN FARMING AND NON-FARMING

The non-farming population forms a larger percentage of the total open-country population in areas that are the most accessible to the city, than in the more inaccessible areas. This is especially marked in Ithaca town (township) of Tompkins County, in which the city of Ithaca is located and where 59.9 per cent of the open-country population is non-farming. The town (township) in Schuyler County with the highest percentage (41.9) of the open-country population non-farming, is Reading. This situation is due to the influence of the salt works in and about the town of Watkins Glen. The town (township) of Montour likewise has a high percentage (29.2) of its open-country population non-farming, due to the village of Montour Falls being dominantly industrial. On the whole, where the proportion of the open-country population which is non-farming is high, it is due largely to industry. Further analyses of the towns (townships) in the two counties would substantiate this statement but would add only unnecessary details.

THE CENSUS FIGURES ON FARM POPULATION

A comparison of the farm population for these two counties as shown by this study, with that given in the United States Census of Agriculture for 1925,⁵ reveals a wide discrepancy. According to the census figures, Tompkins County had a farm population of 9319 and Schuyler County 6073. This study shows Tompkins County as having a farm population of only 8050, and Schuyler County 4988. In each county the difference is more than 1000.

These variations are due to the definition of a farm as followed in taking the Census of Agriculture, and to the fact that in this study an individual was classified according to his stated occupation. The census definition of a farm

⁵ Part II. The Northern States, page 229.

was; "A 'farm', for census purposes, is all the land which is directly farmed by one person, either by his own labor alone or with the assistance of members of his household or hired employees." In applying the foregoing definition of a farm for census purposes, enumerators were instructed to report as a "farm" any tract of 3 or more acres used for agricultural purposes, and also any tract containing less than 3 acres which produced at least \$250 worth of farm products in the year 1924.⁶

In the State Census of 1925, the occupation of each person was listed but nothing was given about any farms. That census concerned only population. In obtaining the figures used in this study, the number of persons per household was added for the households in which the head was listed as a farmer. Even this method might lend itself to an error on the side of giving too large a number, since in many cases grown sons or daughters were living at home on the farm but were following some other occupation in the neighboring city, town, or village. It is assumed here, however, that a sufficiently large number of wives were doing enough farm work to allow of their being classed as farm population, which compensates for our own possibly too high figures on the farm population.

It is believed that the number of persons belonging to the farm population as given in this work is more nearly accurate than that given in the census. This position is taken because the census report fails to take any account of the large number of persons who are living in the open country, often on farms which in the past they have used for agricultural purposes, but who are gaining their living from a wage income in some city, town, or village industrial plant.

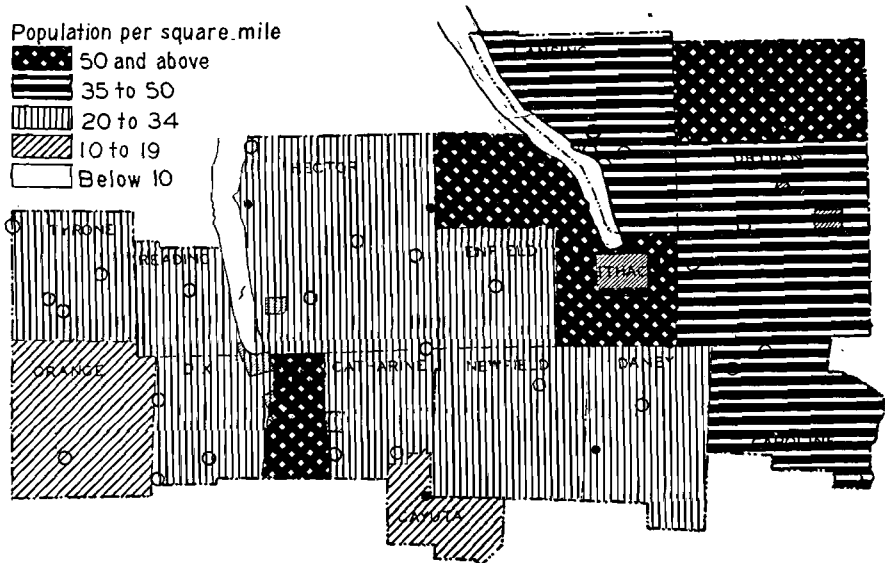

FIGURE 5. DENSITY OF RURAL POPULATION (SEE PAGE 12)

⁶ United States Census of Agriculture, 1925. Part II. The Northern States, page VII.

DENSITY OF POPULATION

The density of the total rural population, the open-country population, and the farm population, are shown in tabular and graphic form in table 5 and figures 5, 6, and 7. Certain pertinent facts emerge from an examination of the table and the figures.

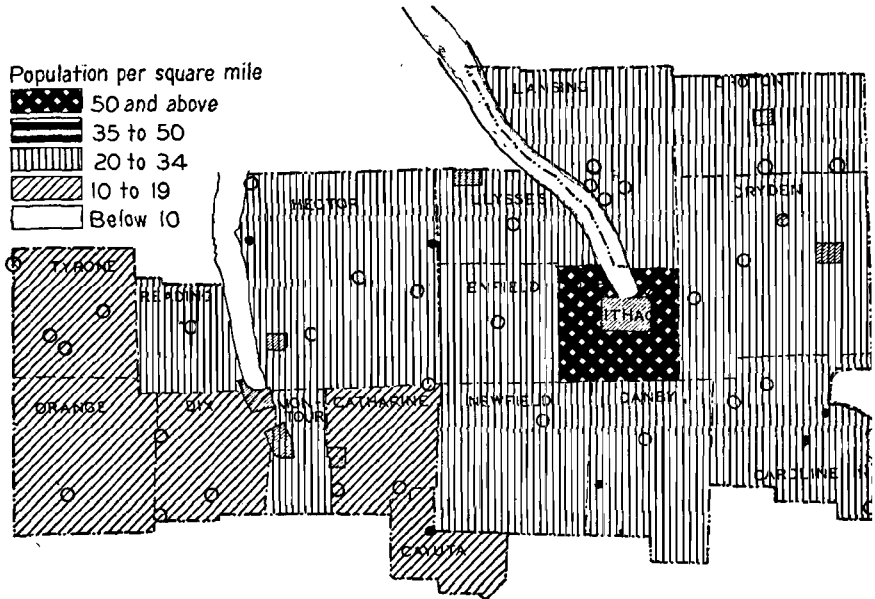

FIGURE 6. DENSITY OF OPEN-COUNTRY POPULATION

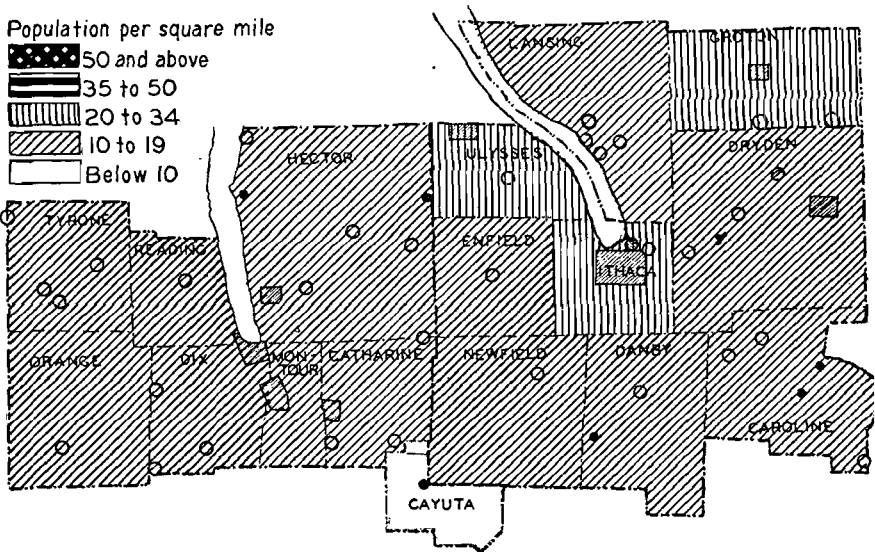

FIGURE 7. DENSITY OF FARM POPULATION

Newfield	1,522	28.9	1,160	22.0	790	15.0
Ulysses	2,470	72.8	1,080	31.8	721	21.2
Schuyler County						
Total for county	10,537	31.3	6,396	19.0	4,960	14.7
Catharine	1,177	32.7	531	14.7	402	11.1
Cayuta	309	12.8	309	12.8	182	7.5
Dix	1,027	26.3	741	19.0	581	14.8
Hector	3,134	28.8	2,203	20.2	1,773	16.2
Montour	1,974	103.5	413	21.7	292	15.3
Orange	825	15.0	700	12.7	588	10.6
Reading	935	33.1	810	28.7	470	16.6
Tyrone	1,156	27.9	732	17.6	700	16.9

Cities and villages (the villages that are both agricultural and industrial) contribute largely in determining the density of rural population. The towns (townships) of greatest rural-population density are Ithaca, Groton, and Ulysses in Tompkins County, and Montour in Schuyler County. The city of Ithaca, and the villages of Groton, Trumansburg, and Montour Falls, are the determinative forces in the situation.

The density of farm population is influenced by soil and topography on the one hand, and the presence of a city on the other. The variation in farm-population density is not great for the different towns (townships) where the topographical and soil conditions are similar, except for the territory of the town (township) in which Ithaca is located.

FOREIGN-BORN POPULATION

The foreign-born population constitutes only 5.3 per cent of the total rural population of the two counties (table 6). The percentage is higher in Tompkins County than in Schuyler County. The foreign-born who work in the salt plant at Myers and in the cement plant at Portland

Point cause the percentage to run higher for the unincorporated villages of Tompkins County than for any other group except the institutions. The foreign-born in the open country are accounted for by two settlements, one of Finns and the other of Bohemians, in the town (township) of Newfield. In that township 14.4 per cent are foreign-born. This percentage does not include the children who have been born in this country. These people settled on abandoned farms some years ago, and now form, with their children, a large bulk of the farm population in this one town (township).

TABLE 6. DISTRIBUTION OF FOREIGN-BORN IN THE RURAL POPULATION

	Rural population	Foreign-born	
		Number	Per cent of rural population

SEX AND AGE DISTRIBUTION

The main objects of this section of the study are to show (a) the ratio of the sexes to each other, (b) the distribution of age groups, and (c) the distribution of sex and age groups, all according to residence. The details are given in tables 7 to 19 and in figure 8; the significant facts are pointed out in the text.

RATIO OF THE SEXES

The number of males considerably exceeds the number of females in the total rural population of both counties, the ratio being 93.6 females to each 100 males (table 7). The proportionate number of females in relation to the number of males is slightly larger for Tompkins than for Schuyler County. This is probably due to the industrial plants in the city of Ithaca, many of whose workers live in the open country, and in the industrial villages of Myers and Portland Point.

TABLE 7. NUMBER OF FEMALES FOR EACH 100 MALES IN EACH CLASS OF THE RURAL POPULATION*

	Number of females per 100 males
Both counties.....	93.6
Incorporated villages.....	108.5
Unincorporated villages.....	95.2
Open country.....	89.5
Tompkins County.....	94.2
Incorporated villages.....	111.1
Unincorporated villages.....	90.6
Open country.....	90.1
Schuyler County.....	92.4
Incorporated villages.....	102.8
Unincorporated villages.....	103.1
Open country.....	88.4
Ithaca†.....	114.6
Watkins Glen†.....	109.2

* Population in institutions is included only in the total for both counties and for each county.
 † Information for Ithaca and Watkins Glen is added only to afford a basis for comparison.

Taking the two counties together, the incorporated villages have a high ratio of females (108.5) to each 100 males, while in the unincorporated villages and the open country the ratios are much lower, 95.2 and 89.5, respectively. There are fewer females to each 100 males in the open-country population than for either of the other classes. The unincorporated villages differ markedly in this respect for the two counties: those of Tompkins County have only 90.6 females to each 100 males, while those of Schuyler County have 103.1 females to each 100 males. This is due to the industrial villages of Myers and Portland Point, both of which are unincorporated.

AGE DISTRIBUTION

The outstanding facts respecting the age comparison of the rural population are the disproportionate numbers of persons below 15 years of age, above 50, and in the productive ages, 15 to 49 inclusive, in comparison with the corresponding figures for New York State and for the United States (figure 8). For the United States (1920), 31.7 per cent are below 15 years of age, 15.3 per cent are 50 years old and above, and 52.7 per cent are within the most productive ages, 15 to 49 inclusive. New York State has 27.6 per cent below 15 years of age, 16.1 per cent 50 years old and above, and 54.2 per cent from 15 to 49 years of age, inclusive. The rural population of the two counties being studied, shows 27.6 per cent below 15 years of age, 26.9 per cent 50 years old and above, and 45.3 per cent from 15 to 49 years of age, inclusive.⁷ Little difference occurs in the

⁷ The decimals being carried to only one place, the total percentages for the five-years periods as shown in figure 8 do not equal these three totals.

age distribution for the total of the rural population of the two counties (tables 8 to 10).

Notable differences exist in the age distribution of the population of the incorporated villages, the unincorporated villages, and the open country. The incorporated villages have the smallest proportion (22 per cent), and the open country the largest proportion (30.1 per cent), below 15 years of age. The unincorporated villages stand between the other two classes (26.5 per cent) in the percentage of the population below 15 years of age, probably due to the industrial villages. The incorporated villages have the largest proportion (29.5 per cent), and the open country

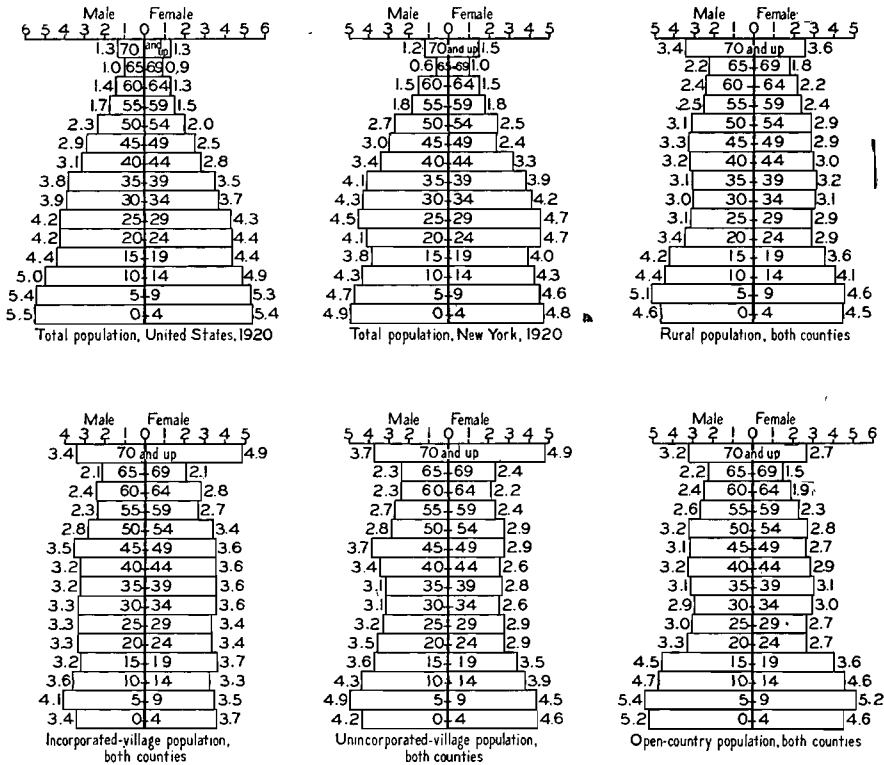

FIGURE 8. PERCENTAGE SEX AND AGE DISTRIBUTION, BY QUINQUENNIAL PERIODS

the smallest proportion (26.2 per cent), 50 years old and above, while the unincorporated villages have 28.9 per cent in that age group.

The average age of the total rural population is 33.6 years; in the incorporated villages it is 36.2 years, in the unincorporated villages 34.8 years, and in the open country 32.2 years.

Some difference exists in the percentage of the population in the productive ages, 15 to 49 inclusive, between the unincorporated villages of

the two counties (Tompkins County 46.5 per cent, and Schuyler County 41.1 per cent). The unincorporated villages in Schuyler County are all agricultural, while two in Tompkins County are entirely industrial, two others are partially industrial, and one is a satellite of Ithaca.

The open-country population is rearing the children; the cities, the industrial towns, and the villages are consuming the mass in the productive ages; and the agricultural villages are the homes of the old people (figure 8).

SEX DISTRIBUTION AND AGE

Certain significant facts stand out respecting the age distribution of the population in relationship to sex. Of the total population 50 years of age and above in the incorporated villages, 16 per cent are females and 13.4 per cent are males. Almost the same percentage (13.8) of the total population of the open country are males of this age, but only 11.4 per cent are females. Also, it is noticeable that the unincorporated villages of Schuyler County have 18.6 per cent of their total females 50 years of age and above, and 17.1 per cent males of the same group. (Tables 8 to 19.)

OCCUPATIONS

In this section the aim is to show (a) in what occupations the rural people are engaged, and (b) the ages of persons employed in various types of work. As a corollary, comparisons respecting occupations, and occupations and ages, are made for the different residential groups of the rural population — that is, incorporated villages, unincorporated villages, and the open country.

CLASSIFICATION OF OCCUPATIONS

The occupations are divided into fifteen classes, using only the members of the population 15 years of age and above. This classification follows, in the main, that of the Federal Census. The occupations are as follows: farm operator, manufacturing, transportation, trade, clerical, domestic, public service, professions, school, retired, farm labor, labor in mines, labor in mechanical industry, labor on roads, and other labor. For the females the additional occupation of housewife is used as a separate category.

In the cases of those engaged in farming and in manufacturing, the method followed here varies slightly from the practice of the Census Bureau. Those engaged in agriculture designated in the tables as *farm operators* are owners, renters, or managers of farms, while a second class engaged in farming is composed of farm laborers. Likewise, those engaged in manufacturing and mechanical industries are separated into two classes. The first class, indicated in the tables as *manufacturing*, are the owners or managers of industrial plants; while those placed in mechanical industries

are laborers in factories, and this classification is put under labor. These divisions were made in order to discover to what extent the rural population is becoming engaged in different types of labor.

The classification known as *domestic* might easily be misleading with no explanation. Following the census practice this category includes: barbers, hairdressers, and manicurists; billiard- and pool-room keepers; boarding- and lodging-house keepers; bootblacks; hotel keepers and managers; housekeepers and stewards; janitors; and others of a somewhat miscellaneous character but of whom there are very few in the rural population of Tompkins and Schuyler Counties.

Labor on roads was placed as a separate classification in order to find whether this special occupation used a large proportion of the gainfully employed inhabitants of the villages.

Retired, as used in this study, includes retired persons and those having no occupation. The no-occupation class accounts for a considerable number being found in the age grouping 15 to 19 years.

Trade includes persons engaged in some commercial enterprise. This term is confusing, since "trade" as commonly used applies to some specific occupation, such as baking or plumbing. Here, however, these are placed under the heading of manufacturing or mechanical industries, in accord with the practice of the Census Bureau.

OCCUPATIONS OF MALES

The occupations in which the rural male population are engaged are considerably diversified (tables 20 to 29, and figure 9). The inhabitants may be divided into two large classes — those who are working on their own initiative and under their own management, and laborers. The latter group is divided into laborers on farms, in mechanical industries, and on roads, those engaged in other labor, and a small number employed in mines. Of the total number of males gainfully employed, 45.9 per cent are farming, either as operators or as laborers. A third large group is composed of laborers in mechanical industries. Thus the third largest contingent of employed males of the rural population is engaged in work dependent not on farming but rather on our wider industrial organization.

The next largest groups, in the percentages of the total population 15 years of age and above, are those in school, those retired, and those engaged in trade, in the order named. The school group constitutes 6.2 per cent of the total, the retired group 5.8 per cent, and the trade group 5.2 per cent. The proportion of the total composed by those who labor on the roads is of some significance (4.1 per cent). The number who are engaged in the professions is not large (3.7 per cent). This small proportion appears to be too small to take adequate care of the services which those engaged in professional work are supposed to render for the mass of the people (figure 9).

These facts disclose that the rural population is heterogeneous, and no longer homogeneous, as regards occupations. Furthermore, the rural population is far from being wholly composed of home-owning farmers, as has been the ideal of the rural-life advocates. Moreover, the occupational organization of rural life throws light upon problems involved for those who would work as leaders in any phase of rural work.

* Not including persons living in institutions.

The percentage distribution of occupations differs for the incorporated villages, the unincorporated villages, and the open country. Almost one-third (30.4 per cent) of the males 15 years of age and above in the incorporated villages are laborers in some form of mechanical industry. The second largest group is composed of those in trade (13.4 per cent), the third of those in the professions (8.8 per cent), the fourth of those in school (7.4 per cent), and the fifth of those retired (7.3 per cent). The number who own, rent, or operate farms constitutes only 6 per cent of the total males occupied.

* Not including persons living in institutions.

In the unincorporated villages, the largest percentage of the total population, 26.7 per cent, are employed in mechanical industries. However, with these villages the farm-operator group ranks next, 15.2 per cent, and farm labor third, 12.4 per cent. Laborers on the roads compose the fourth largest group, 8.7 per cent, in the unincorporated villages. The percentages of the total which those in trade and those retired constitute, 6.5 per cent and 6.6 per cent respectively, are somewhat significant. Persons engaged in trade are usually the leaders in the villages, but their numbers are balanced by the retired group.

The largest number (41.7 per cent) of males occupied in the open country are operators of farms. The second group is made up of farm laborers (22.1 per cent), and the third group is made up of laborers in the mechanical industries (9.9 per cent).

OCCUPATIONS OF FEMALES

More than 90 per cent of the females 15 years of age and above, in the rural population, are housewives, retired, in school, or in some profession. Of the total females 15 years of age and above, 64.5 per cent are housewives, 15.4 per cent are retired, 6.5 per cent are in school, and 3.8 per cent are in professional work (table 30). The female population is engaged in other occupations also, but no one of these ranks high in percentage.

A comparison between the incorporated villages, the unincorporated villages, and the open country shows some deviations from the total rural female population as respects the work in which they are engaged. Housewives compose the largest number in all three of these residential classes, but the respective percentages of the total are: incorporated villages 57.7, unincorporated villages 62.8, and open country 68.3. The second largest group, the retired, constitutes 18.2 per cent of the total in the unincorporated villages, 15 per cent in the open country, and 14.7 per cent in the incorporated villages. The proportion of the total who are in professions is higher for the incorporated villages (4.9 per cent) than for either the unincorporated villages or the open country. Furthermore, the clerical and domestic groups play some part in the incorporated villages, forming 3.7 and 4.5 per cent, respectively, of the total female population 15 years of age and above. (Tables 30 to 39.)

AGE AND OCCUPATIONS

Do the gainfully employed in certain occupations belong to special age groups more than those in other occupations? Are those who are engaged in agriculture older or younger, on the whole, than those engaged in transportation? Are those employed on the roads older or younger than those working in trade?

To answer these and similar questions, six occupations were selected and studied. These were: farm operator; farm labor; labor on roads; transportation; trade; and labor in mechanical industry. The percentage of the total employed in each occupation, for each quinquennial age group, was found and placed in the graphs (figure 10). The percentage of the total population 15 years of age and above, for each five-years period, is placed in each group for each of the residential groups, to afford a means of comparison for each occupation.

Taking the rural population as a whole, the preponderance of those engaged as farm operators are in the 30-34-years age group and above, while farm laborers are proportionately below that age. Thus, in each age period above 34 years the percentage of the total gainfully employed 15 years of age and above is greater for farm operators than the percentage of the total population for a corresponding age group.⁸ On the other hand, the percentage of all farm laborers belonging to the age groups above 34 years is smaller than the percentage of the total in any corresponding age group except that of 70 years and above. It is difficult to generalize for the total rural population respecting the ages of those who work on the roads. The age groupings fluctuate in such a way that there seems to be no dividing point where either the old or the young are found in that occupation, particularly when considering the whole of the employed male population.

Transportation, and labor in mechanical industry, draw the bulk of their population from the age groups below 45 years. The graph showing the percentage of the total number in each occupation in each age group shows a decided drop for transportation and mechanical industry at the 40-44-years point, though the curve for trade holds up. Respecting trade, the graph shows that in all except one age group, the percentage of the total in trade for each age group from 40 to 59 years is greater than the percentage of the total males in each age group. This means that the older people are handling the commercial transactions, as well as being the farm operators, in rural territory.

An examination of the situation for the incorporated villages, the unincorporated villages, and the open country, shows certain variations from the foregoing generalizations for the three different residential classes.

Farm operators who live in the incorporated villages decidedly belong in the older age groups, 16.6 per cent of these being in the 60-64-years age group. The large mass of those living in the unincorporated villages and working on the roads are below 50 years of age. Those above the 30-34-years age group in the unincorporated villages are engaged in trade out of proportion to the percentage of the total population 15 years of age and above.

⁸ It should be noted that the graphs in figure 10, and this discussion, are based entirely on the male population 15 years of age and above.

FIGURE 10. PERCENTAGE OF MALE POPULATION IN EACH OF SIX SELECTED OCCUPATIONS, BY EACH QUINQUENNIAL AGE PERIOD

The four charts on the left show the distribution of persons engaged as farm operators, in farm labor, and in labor on the roads; the four on the right show the distribution of those engaged in transportation, trade, and mechanical industry. The charts are thus separated and placed in order to facilitate comparisons and prevent a complication of data on any one chart

The condition regarding the age distribution in occupations shows certain extremes in the open country. Slightly more than one-fourth (25.1 per cent) of all who live in the open country and are working in transportation belong in the 20-24-years age group. Likewise, more than 32 per cent of the total who are in some form of trade are from 20 to 29 years of age.

THE FAMILY

The concern of this particular section is with the distribution of widows and widowers, and the size of the family as found in the rural population and in its various residential groups.

WIDOWS AND WIDOWERS

The percentage of women who are widows (7.9) is a little more than twice the percentage of men who are widowers (3.7), taking the total rural population of the two counties (table 40). The percentage of women who are widows is much higher in all three classes of the rural population than the percentage of men who are widowers. The percentage of men in the open country who are widowers (3.8) is higher than that in either the incorporated or the unincorporated villages; but the percentage of women of the open country who are widows (6.4) is lower than that in the incorporated or the unincorporated villages.

A comparison of the two counties shows larger percentages of widows and widowers for all classes of the rural population in Schuyler County than in Tompkins County. Schuyler County is dominated by agricultural conditions more than is Tompkins County.

TABLE 40. NUMBER OF WIDOWS AND WIDOWERS, AND PERCENTAGE OF THE FEMALE AND THE MALE POPULATION 15 YEARS OF AGE AND ABOVE, RESPECTIVELY, WHICH EACH CONSTITUTES

SIZE OF FAMILIES

The average size of rural families in the two counties is 3, and the average size of the household is 3.3 (table 41). (The household includes all persons living in a home.) The families are smallest in the incorporated villages (average 2.7), and largest in the open country (average 3.2).

TABLE 41. NUMBER OF FAMILIES, AVERAGE SIZE OF FAMILIES AND OF HOUSEHOLDS, AND NUMBER OF FAMILIES OF DIFFERENT SIZES

Unincorporated villages	643	2.6	2.7	172	222	106	73	28	14	11	9	3	5	
Open country	1,832	3.2	3.5	307	537	338	264	137	98	64	37	25	25	

Differences exist in the average size of the families for the two counties. Taking the total rural population, the families of Tompkins County average 3.1 persons and those of Schuyler County average 2.9. This variation is due to the average size of the families in the unincorporated villages. The families in the unincorporated villages of Tompkins County average 3.2 persons, but those of Schuyler County average only 2.6. The industrial and satellite character of a few unincorporated villages in Tompkins County accounts for this difference (pages 49 to 52).

Families of two persons constitute almost one-third (31.6 per cent) of all the rural families in the two counties (table 42). Of all the families

TABLE 42. PERCENTAGE OF THE TOTAL NUMBER OF FAMILIES OF DIFFERENT SIZES

Open country	16.7	29.3	18.4	14.4	7.4	5.3	3.4	2.0	1.3	1.3	

in the incorporated villages, 36.4 per cent have only two persons and 16.6 per cent have only one person, bringing more than half of the families in these two sizes. The one-person family is especially prevalent in the unincorporated villages, composing 21.7 per cent of the total. The one-person family forms 26.7 per cent of all the families in the unincorporated villages of Schuyler County, but only 17.7 per cent in Tompkins County. Families with four or more members constitute larger percentages of the total in the open country than in either the incorporated or the unincorporated villages.

Those of the open country who are owners or renters and farm laborers average 3.4 persons per family, while others average 2.9 each. Farm labor has a larger proportion of its families with five or more members than have the owners or the renters. (Tables 43 to 45.)

The special function of a village has the greatest influence on the size of the families living in that village. Myers and Portland Point, in the

first of which the workers are largely employed in a salt plant and in the second in a cement factory, afford good examples of this. The average size of the families in Myers is 4, and in Portland Point 4.5. Furthermore, the average for Forest Home, a satellite composed largely of faculty members and employees of Cornell University, is 4. The averages for Dryden and Trumansburg, which are dominantly agricultural, are 2.6 and 2.5, respectively. These few illustrations show the general conditions.

CONDITIONING FACTORS IN SEX AND AGE DISTRIBUTION

This section of the study is devoted to an examination of the data on particular villages and towns (townships) to find the special influences conditioning sex and age distribution. The data are presented in tables 46 to 62, inclusive, and in figures 11 A, 11 B, and 11 C. The method followed is largely that of a case analysis. The age distribution for Syracuse by five-year periods is given in the figure, to afford a comparison. The arrangement in the figure is not in the order discussed, since the figure is designed to afford comparisons of types.

FIGURE 11 A. AGE DISTRIBUTION OF POPULATION IN THE CITY OF SYRACUSE, IN THE TOWN OF WATKINS GLEN, AND IN SELECTED VILLAGES

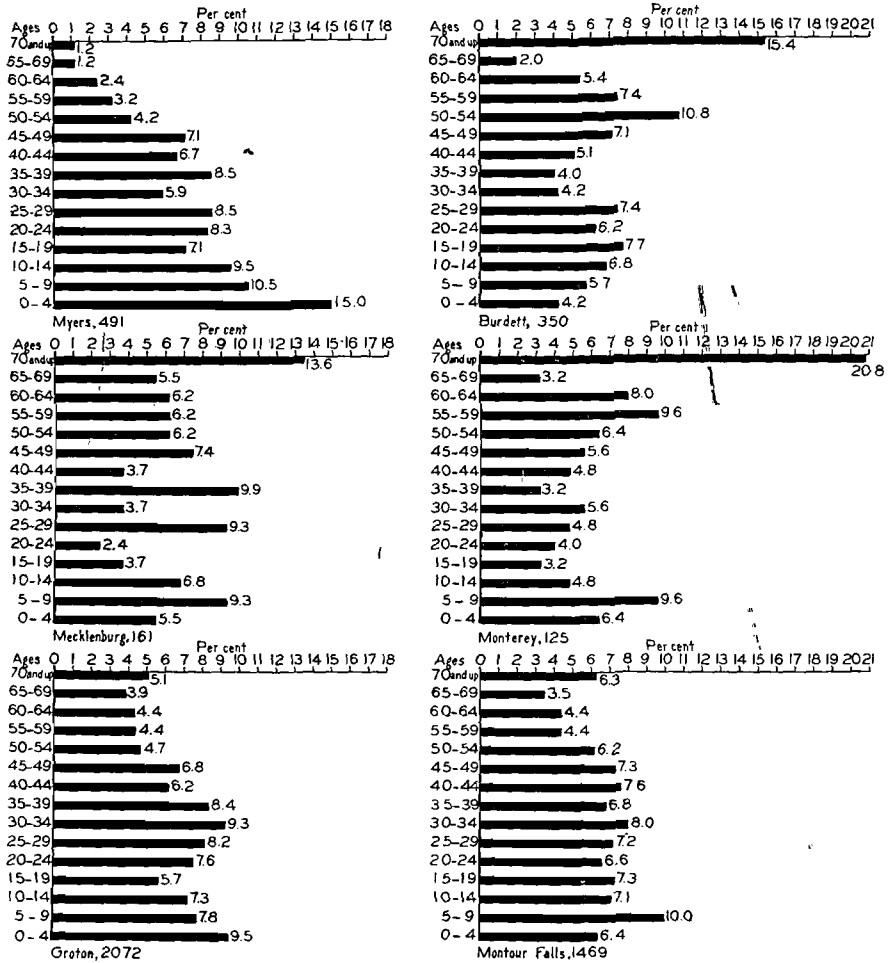

FIGURE II B. AGE DISTRIBUTION OF POPULATION IN SELECTED VILLAGES

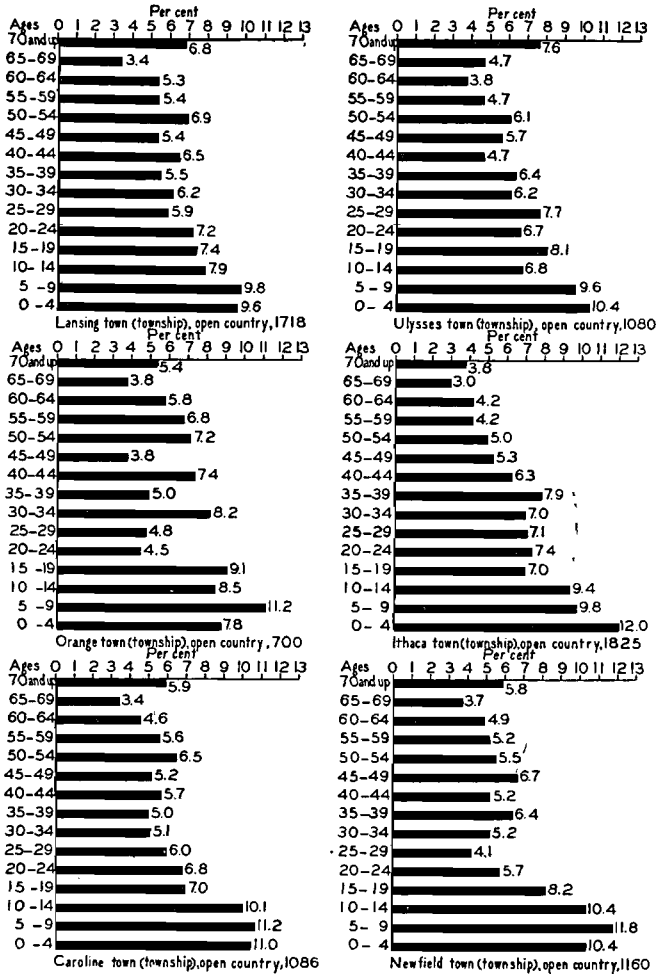

FIGURE 11 C. AGE DISTRIBUTION OF POPULATION IN THE OPEN COUNTRY IN SELECTED TOWNS (TOWNSHIPS)

THE TOURIST TOWN

Watkins Glen is first given attention. This is a town of 2919 population. It has not been classed with the rural population in this study, but data on it are added here since it is a little above a village in size and is the county seat of Schuyler County. In addition to being a county-seat town and a center for the farm population, it is dominantly a tourist center. The noted Watkins Glen, which is now in a beautiful state park, is located here and draws thousands of visitors each year. "Homes for tourists" are common on the main street. The chief characteristics in the sex and age distribution are: females constitute 52.2 per cent of the total; the average age of the total population is 33.2 years, the females averaging a little older

than the males; 48.5 per cent of the population are in the productive ages, from 15 to 49 years inclusive, and 25.5 per cent are 50 years of age and above (table 46).

VILLAGES IN AGRICULTURAL AREAS

The villages selected to represent agricultural centers are Odessa (table 47), McLean (table 48), and Mecklenburg (table 49). Odessa is incorporated, but the other two villages are not. All are in agricultural areas where the land is yet predominantly under cultivation. Odessa has many progressive characteristics.⁹ The average age of its population is 37.9 years; 30.7 per cent of the total are 50 years of age and above; and 50.3 per cent are in the productive ages, 15 to 49 years inclusive. McLean has a population whose average age is 41.9 years; 42.7 per cent of the total are 50 years of age and above; and only 37.1 per cent are in the productive ages 15 to 49 years inclusive. The population of Mecklenburg resembles very closely that of McLean. The average age of its population is 40.2 years; 37.8 per cent of the total are 50 years of age and above; and 40.3 per cent are in the productive ages, 15 to 49 years inclusive. Also, 20.4 per cent of the total population are women of the age of 50 years and above. McLean and Mecklenburg appear to be declining villages; they are no longer important centers for the rural population. However, these percentage distributions as to sex and age seem to characterize even larger villages in farming areas.¹⁰

VILLAGES IN AREAS OF FARM ABANDONMENT

Monterey and Burdett, in Schuyler County, were chosen for special consideration as examples of villages located in areas of farm abandonment or in process of farm abandonment (tables 50 and 51, and figure 12).

FIGURE 12. AREAS OF ABANDONED FARMS AND IN PROCESS OF FARM ABANDONMENT

(Based on findings of Lawrence M. Vaughan, published in Bulletin 490 of the Cornell University Agricultural Experiment Station, *Abandoned Farm Areas in New York*)

Average age (years).....	40.9			40.4			41.3	

Monterey, with a population of 125, is the largest place in Orange town (township), and a large share of its land is in process of abandonment. The average age of the population in Monterey is 43.6 years; 48 per cent of the total are 50 years of age and above, and only 31.2 per cent are within the productive ages of 15 to 49 years inclusive. Furthermore, 24 per cent of the total are women 50 years of age and above. Burdett lies within about three miles of Watkins. To the east of the village much of the land is abandoned or in process of abandonment, though to the north lies a stretch of land devoted to fruit raising. The average age of the population in Burdett is 40.9 years; 41.1 per cent of the total are 50 years of age and above; a very small proportion (16.8 per cent) are below 15 years old. Age predominates in these villages.

INDUSTRIAL VILLAGES

The industrial villages analyzed are Myers (table 52), Groton (table 53), and Montour Falls (table 54). Myers is built about a salt plant; its workers are largely foreign-born or children of the foreign-born. Of its total population, 58.6 per cent are males; the average age is only 25.5 years; only 12.4 per cent of the total are 50 years of age and above; 35.2 per cent are below 15 years of age; and the remainder, 52.3 per cent, are in the productive ages, 15 to 49 years inclusive. Thus the industrial village of this type draws the males in the productive ages, which in turn makes for a large proportion of children below 15 years of age. Groton (the home of the Corona Typewriter) and Montour Falls (in which the principal factory is Shepard's Electric Crane and Hoist Company) have the same characteristics in the age distribution of their population, though

not to such extremes (tables 53 and 54). The males do not predominate in these villages as they do in Myers, due to the fact that the workers are largely native-born of native parentage.

SATELLITE VILLAGES

Cayuga Heights and Forest Home are both contiguous to Ithaca. The former is incorporated, the latter is not. The population of Cayuga Heights is composed largely of university people and some of the more prosperous of Ithaca's business men. Forest Home is practically a settlement of members of the university faculty and workers connected with the University. Cayuga Heights has only 18.6 per cent of its population 50 years of age and above, with 24.8 per cent below 15 years of age and 56.4 per cent in the productive ages, 15 to 49 years inclusive (table 55). The number of females runs considerably larger than the number of males, 45.4 per cent of the population being males and 54.5 per cent females. Forest Home has a very different condition respecting its sex distribution, 55.1 per cent of the total being males and 44.8 per cent females (table 56). A larger proportion of the total, 30.5 per cent, are below 15 years of age than in the village of Cayuga Heights, while a smaller proportion, only 15.9 per cent, are 50 years of age and above. The productive ages, 15 to 49 years inclusive, include 53.5 per cent of the total population in Forest Home.

THE OPEN COUNTRY

The towns (townships) of Lansing, Ulysses, Ithaca, Caroline, and Newfield, in Tompkins County, and Orange in Schuyler County, were chosen to compare the sex and age composition of the open country as determined by varying conditions. Lansing and Ulysses are largely dairy-ing and general-farming areas, having the best land of Tompkins County. Ithaca and Caroline have much land not under cultivation, and many of the open-country people in these towns (townships) are working in the city of Ithaca.¹¹ The larger share of Orange town (township) is covered with abandoned farm land. (Figure 12.) Likewise, much of the farm land of Newfield has been abandoned, and part of it has been settled by Finns and Bohemians.

A comparison of these towns (townships) reveals the influence of the various conditions of the age distribution of the open-country population. The three towns (townships) Lansing, Ulysses, and Orange, of which the first two are agricultural and the third is in process of abandonment, have a population with an average age of a little over 33 years. The population of Ithaca town (township) averages 30.2 years of age, while that of Caroline averages 31.7 years and that of Newfield 31.8 years. The towns of Lansing, Ulysses, and Orange have higher percentages of their population 50 years of age and above, and lower percentages below 15 years, than have the towns of Ithaca, Caroline, and Newfield. (Tables 57 to 62.)

¹¹ A full discussion of the characteristics of Caroline is given in *Social Relationships of the Slaterville Springs - Brooktondale Area, Tompkins County, New York*, by Glenn A. Bakkum and Bruce L. Melvin. (In process of publication by the Cornell University Agricultural Experiment Station.)

SIGNIFICANT FINDINGS

1. Rural population in Tompkins and Schuyler Counties is composed of four residential classes: (a) approximately 60 per cent (60.7) live in the open country; (b) 23 per cent live in incorporated villages; (c) 15 per cent live in unincorporated villages; and (d) 1.2 per cent live in institutions.

2. The open-country population is no longer purely farming, since 31 per cent of it constitutes a non-farming group. Many persons are living in the open country but working in the city of Ithaca; 59.9 per cent of the open-country population in Ithaca town (township), in which Ithaca is located, is non-farming.

3. Cities, towns, and villages influence the density of the *open-country* population more than does the type of farming. The township of Ithaca has an open-country population density of 54.5 per square mile, while Cayuta town (township) in Schuyler County, the farthest removed of any from urban influence, has 12.8 per square mile. The type of soil and the general character of the farming determine the density of *farm* population.

4. The figures of the Federal Census for the farm population in 1925 for these two counties are approximately 1000 higher for each county than those obtained in this study. This variation is due to the fact that the Federal Census counted a family as being farmers if they were on a farm of three or more acres, while in this study the occupation to which the person stated he belonged was used, regardless of the size of the farm on which he might be living.

5. In the rural population there are 93.6 females to each 100 males. The incorporated villages have 108.5 females to each 100 males, which condition also characterizes the unincorporated agricultural villages. The ratio for the unincorporated villages is 95.2 females to each 100 males, due to the influence of the satellite and industrial villages. In the open country the ratio of females to males is 89.5 to 100.

6. Of the total rural population, 27.6 per cent are below 15 years of age, 26.9 per cent are 50 years of age and above, and 45.3 per cent are in the productive ages, 15 to 49 years inclusive. The average age is 33.6 years. The older people live in the incorporated villages. In these villages 29.5 per cent of the total population are 50 years of age and above, 48.4 per cent are in the productive ages, 15 to 49 years inclusive, and 22 per cent are under 15 years of age; and the average age is 36.2 years. This situation is very similar in the unincorporated agricultural villages.

In the open country 44.5 per cent of the total are in the productive ages, 15 to 49 years inclusive, 30.1 per cent are under 15 years, and 25.2 per cent are 50 years of age and above. The distribution for the United States is: under 15 years, 31.5 per cent; 15 to 49 years inclusive, 53.8 per cent; 50 years and above, 14.7 per cent.

7. The occupations in which the gainfully employed males 15 years of age and above, for the total rural population, are engaged, in the order of their significance, are: farm operator, labor in mechanical industry, labor on farms, school, retired, trade, labor on roads, other labor, professions, transportation, manufacturing, domestic service, clerical, labor in mines, and public service. Farm operators form 29.4 per cent of the total, and farm laborers 16.5 per cent. The second largest group is 17.2 per cent, who are laborers in mechanical industry.

8. The incorporated villages are industrial rather than commercial; 30.4 per cent of the gainfully employed males in these villages are laborers in mechanical industry, and 13.4 per cent are in trade.

In the open country, 41.7 per cent of the total gainfully employed are farm operators and 22.1 per cent are farm laborers.

9. Taking all the rural women 15 years of age and above, the occupations in the order of importance are: housewife, 64.5 per cent; retired, 15.4 per cent; school, 6.5 per cent; professions, 3.8 per cent.

In the open country 68.3 per cent, in the unincorporated villages 62.8 per cent, and in the incorporated villages 57.7 per cent, of the women are housewives.

10. Farm operators are largely above 34 years of age; in the incorporated villages they are largely above 44 years. Men above 34 years of age control the trade in the villages, while the preponderance of those engaged in transportation are below 45 years.

11. For all the rural families the average size is 3 persons; those of the incorporated villages number 2.7, those of the unincorporated villages 2.9, and those of the open country 3.2.

Families in industrial villages are larger than those in agricultural villages. In two industrial villages, Myers and Portland Point, the families average 4 and 4.5 persons, respectively, while in two agricultural villages selected at random, Freeville and Trumansburg, the families average 2.6 and 2.5 persons, respectively.

12. The purely industrial villages have the mass of their population in the productive ages, 15 to 49 years inclusive, and below 15 years of age. The agricultural villages, both incorporated and unincorporated, have a very high proportion 50 years of age and above, as, for example, 30.7 per cent in Odessa and 42.7 per cent in McLean.

13. The findings in this study have marked practical significance for the sociologist, the worker in vital statistics, or any one who is concerned with having an exact knowledge of the residential and the sex and age distribution of our rural population. The fact that relatively high percentages of the total population of villages which are in agricultural territory are 50 years of age and above, may partly account for the prevalent unprogressiveness of such places together with the rabid conflicts that frequently rage within them.¹²

Moreover, pertinent problems face the teacher, the preacher, the extension worker from the agricultural college, or any leader who desires to develop rural group activities. Can organizations be stimulated and developed about the village? Can the older people of the village mix with the younger ones from the open country in religious, social, educational, or recreational programs which have as their purpose the promotion of some progressive activities? Are these villages likely to deteriorate and disappear as the older people die? If they are, then what institutions should be encouraged and given financial support?

A statement that the urban death rate per 1000 is 13.7 and the rural death rate is 12.9¹³ means very little when it is realized that to the rural

¹² This subject is discussed in *Sex and Age Distribution of Rural Population in Relation to Rural Behavior*, by Bruce L. Melvin. (Publication of the American Sociological Society, 1928.)

¹³ Urban and rural death rate exclusive of New York City in New York State, 1928. Forty-seventh annual report of the State Department of Health, page xvi.

population belong diverse age groups according to residence in villages or in the open country. The two most dangerous periods of life are childhood and old age. The children are found in the open country and the old people in the villages. Also, when compared with the cities, the rural population, both in the villages and in the open country, has a small proportion of the total in the productive and reproductive ages from 15 to 49 years inclusive. Thus, what does a death rate mean?

The prevalent practice of the United States Bureau of the Census in throwing together all of the population outside places of 2500 and above, and calling it rural, is inadequate and unreliable if accurate work is desired using their findings as a base. If it is of value to classify the population of the cities of 100,000 and above into five-year age and sex classes, it is of like value for the different groups of the rural population to be handled in the same way. If it is impracticable because of lack of funds for the Census Bureau to do this, monographs could be written on the rural population using selected areas from various States.
