To JAMES ANDERSON, ESQUIRE,

Physician General.

SIR,

AVI directed by Colonel Brait's waite to inclose to you a copy A of a letter from him to Government, which accompanied reports of the Officers commanling Cavalry Stations (Major Stevenson excepted) relative to your proposal for the cultivation of the Bailard Cedar.

WALTER WILSON, SECRETARY.

Head Quarters, March 13th, 1791.

N-SOURCE STREET, To the Hon. SIR CHARLES OAKELEY,

Governor in Council.

HONORABLE SIR,

HAVE been thus long prevented from replying to a letter of Mr. Secretary Jackson's, of the 24th of January, enclosing a copy of a letter from the Physician General, recommending the cultivation of the bastard Cedar Tree, at the Catalry Cantonments, for the feeding horses, waiting for the reports from the several Commanding Officers of the Cavalry Regiments, and am now unwilling longer to delay laying the refult before your Honorable Board, although I have not as yet received a reply from Major Stevenson, which I attribute to this extreme ill state of health.

I imagine that the four letters, of which I have now the honor to enclose copies, will suffice to enable government to form a judgment (viz.) one from Colonel Floyd, one from Major Younge,

one from Major Pater, and one from Major Orr.

These gentleman, in general, seem to think the measure will be of great utility, and I think, although the subject of the expence

has not been fully gone into, that fufficient has been faid to ensble government to form a very near guess what expence will attend the causing five such Plantations to be made, namely, one at each Cavalry station-and I am of opinion that the expence will be warranted by introducing through these means generally, the cultivation of a tree which is stated to afford such excellent food for cattle, by which, no doubt, agriculture will be much affifted; and I will own to you that I look more to fuch general advantage, to be derived from it, than to its particular utility in affording food for horses, and that for a reason which I am surprized has not occurred to any of those Officers, whose letters I have now the honor to enclose, and that is (taking it for granted that it is good and wholesome food for horses,) whether it is a wife measure, to accustom the horses in peace time, at their Cantonments, to a very fweet and nutritious food, which cannot by any means be carried to the field with them, as the fudden change of diet, and particularly from a rich fucculent food, fuch as this is described to be, may occasion them to fall off, and become so weak, as not to recover their strength again during the campaign, which appears to me a consideration deserving of the most serious attention.

The fituation I now hold, has caused me to think it a duty incumbent on me to state what may materially affect the service. I am nevertheless a great advocate for introducing the growth of these trees, on the general principle of their affording nourishment for cattle; and think Doctor Anderson has great merit in starting the subject, and as the Officers who have written on the subject all appear willing and desirous to superintend the cultivation, I cannot but recommend that the Plantations should be made,

JOHN BRAITHWAITE,

A true Copy, (figned) WALTER WILSON, SECRETARY, Military Head Quarters, Madras, March 12th, 1795.

To JAMES ANDERSON, Esquire,

OUGHT to have acknowledged before now the receipt of your books, and of the plants you have been fo good as to fend me; I hope that the Jamaica Plant will do well here, as its foliage would be a great bleffing in this parched country.

Although

Although I have not done mylelf the honor of writing to you before, I have not been an inattentive, nor an indifferent speciator, of the great and laudable exertions you have made to ferve your country, and I now heartly rejoice to learn that you have succeeded to

a degree that could not have been expected.

I wish I could give you a similar account of the improvements of this side of India; but we have hitherto had no person like you, to remove our prejudices, not to stimulate our exertions; a little indeed has been done in Salsette. A few years ago, I procured two or three hundred acres of land on that Island, for the purpose of making trials of several kinds of culture: Mr. Stewart, whom you have seen at Madras, has been permitted by this government to reside there, and we have now a crop of sugarcane in great perfection. We find costee and some other articles, answer very well, but we

have hitherto not succeeded with indigo.

I should be extremely obliged to you to send me an account of your method at Madras of preparing chunam for buildings, terraces, tanks, &c. for I understand you excel us very much in these works; I believe that the chunam that you use is no better than what we have here, not perhaps so good as that we import from Arabia. The difference therefore must arise from the ingredients that you mix with it, or, in some degree, from the method of working it; you will do me a very great favor if you will fend a specimen of all the substances that you pet into the chunam, and their history, as far as it is known. It appears to me, from whatever I have seen here, that the art of the Indians consists merely in producing an acid similar to the acid of sugar, which unites with the lime, and forms a compound superior to selenite in being infoluble in water, and in other respects.

I hope you will excuse me for the trouble that I have ventured to put you to, and I beg, as soon as is convenient, that you will

favor me with an answer.

H. SCOTT.

Bombay, October 24th, 1793.

TO DOCTOR SCOTT, BOMBAY.

AM favored with your letter of October 24th, which gives me much pleasure, as the commencement you have made will no doubt be extended to the countries lately ceded by Tippoo, where in a lower latitude you will experience less difference of heat and cold, and thereby carry on the culture of tropical pro-

ductions with more ease than on Salsette, as well as that your pol.

selfions there are more extensive.

I he only nicety I know, in the culture of indigo, is to fow it at the commencement of the feafon of heavy dews falling, which here is the month of January, as by this means the plant is preferred during its tender state; but no doubt the seafons must be very different on the Malabar Coast, where the heavy rains which are always hurtful to indigo sall in the S. W. Monsoon when the sun is in its northern declination.

I shall foon fend you more feeds of the bastard Cedar of Jamaica, which will very well reward every one who rears it in these parched countries, in the feeding and preservation of their cattle.

I enclose a memorandum lest by my friend Colonel Floyd, who is very destrous of getting the kind of horse from Arabia, of which he has given an account; in obtaining which, if you can give us any assistance, it will lay both him and me under a very great obligation.

I likewise send answers to your queries about chunam, which I hope will prove satisfactory and applicable to use, and will fend you a copy of my farther Public Correspondence,

as foon as it returns from the Press.

And am, DEAR SIR, Your very obedient Servant,

JAMES ANDERSON.

Fort St. George, January 27th, 1794.

MEMORANDUM FOR DOCTOR SCOTT, AT COLONEL FLOYD'S

HE wishes to provide an Arabian horse, of the race, called Cachlani.—This is said to be preserved by the Redouins inhabiting between Eustera and Syria,—he wishes the Horse to be 4, 5, 6, or 7 years old, of the largest size, and strongest make, and if possible to procure a certificate of his Breed.—The history of the Cachlani race, or even sables of their origin.

Colonel Floyd would go as far as 500 or even 1000 Pago. das, for an unquestionable fine young horse, of an age sit to ride, of this breed; and would prefer such an one as the

Arabians themselves esteem.

ANSWERS

ANSWERS TO DOGTOR SCOTT'S QUERIES, REGARDING CHUNAM, &c.

Question 1st.—The chunam here is found in low lands, and in small detached pieces, never as in Europe, in rocks, or on high grounds.

Is the same the case at Madras? what appears to be the reason

of this in tropical countries?

driftver 1/t.—The chunam here is found in the same manner, and chiefly collected from the ploughed sields, although we

have likewise great strata's of shell marble.

There is nothing in this peculiar to tropical countries, further than as they are more favorable to animalization the means by which pature operates the separation of calcarious earth from the general mass.

Questim 2d .- Have you any chalk?

A Jwer 2d .- I ac Luna, which is the matrix of diamend here,

is the nearest approach that I have feen to chalk?

Question 3d—What ingredients are added in different works, to your chunam, and in what proportions? by what rule is it afcertained that the infusion of these ingredients is in proper proportion to the chunam?

Answer 3d.—One parrah, about a bushel, of chunam, well mixed with two parrahs of coarse sand, by beating, and water added, till it is of the confisence of a paste, is all the preparation it receives till it is brought to the bricklayers, who have pots of water standing by them, in which an eighth part of as much jaggery (coarse sugar) is dissolved, that is to say, a pound of sugar to

a gallon of water.

With this fugar and water, the passe, or mortar is mixed with only two or three strokes of the trowel, and more of the sugar and water added, till it is rendered so liquid as to run into, and sill up all the chinks and crevices of the building, when another course of bricks is laid, and the application of the mortar again repeated, and so on alternately, till the wall or building is compleated.

For this kind of work and for the quantity of line abovementioned, about ten pollums (the pollum ten pagodas weight) of

fugar is commonly used.

A wall fo contructed, is afterwards covered over with a coat of what is called coarfe chunam; for which one partal of chunam is mixed by beating as before, with a tick refembling homan

Roman pilum, with an equal quantity of coarle land, in the ap-

plication of which five pollum of fugar is used.

To render the face of the wall perfectly even, and prepare it for receiving the polified coat, a fecond evering is applied, confifting of four partah of fine chunam, mixed by grinding on a granite flab, with one partah of white fand.

The fand is previously fifted, to prevent the mixture of small flones, no jaggery is mixed with this, or any addition but water,

which should be perfectly sweet.

Last of all, the fine chunam, to receive a polish, is applied; for which the shells of shell sish are preferred, in the proportion of six parrahs ground very sine on a granite slab with a granite role ler, to one parrah of the purest white chrystalline sand, till by the

addition of water they become a fmosth uniform paste,

To this, the following ingredients are added, while the passe is spreading on the wall. For twenty feet square, tyre (turned milk) one measure or three pints, sour eggs, sive pollum of ghee or butter, and three pollum of soap stone (Lapis Ollaris) powdered and mixed with the hand, as they are used; they reckon that the work polithes better likewise when two or three pollum of the soap stone has been previously mixed with the passe.

The fine chunam now applied, must be well rabbed with polished steel trowels for a considerable time, the more labour that is bestowed, the more beautiful it becomes: the water that exudes from it (and it will sweat like a person in the hot bath) must be wiped off, and if any cracks appear, the trowel must be again diligently applied; it will continue to sweat for some days according to the state of the weather, and the water should be carefully wiped off every morning with clean cloths, otherwise the colour will be tarnished.

It is now dufted with powdered foap ftone in a linen bag, and the last polish given by rabbing with pieces of polished granite, or petrofilix; in short this labor continues, while there is any exudation of moisture, and until the work is perfectly consolidated.

Question 4th.—Is quick-lime preferred to lime that has been kept for some time, provided the latter continues in a subtle

powder?

Answer 4th.—They pay no regard to this, and for all the purposes I have mentioned the lime is generally brought hot

from the kiln before it is compleatly flacked.

Question 5th.—Where do you get the sand that you mix with the lime? must it be pure silicious earth, or do they use such as is mixed with shells, calcarious earth, or alumine? are they in the habit of using powdered brick, instead of sand?

Answer

Answer 5th.—For building, they use the sand of any stream where the water is sweet; which hereabouts is selt spar and quartz, being fragments of the granite rock of which the Peniasula chief. In conflict, but for mixture with the polished chunam, we have a Bank at Trivatore, on the sea Beach, of pure chrystalline white sand.

All faliae matter, except fugar, and the other ingredients I have mentioned, are deemed hurtful. Our walls are corroded here by the spray of the sea, and vapours from the earth, where

the foil is aluminous.

They make terraces of broken bricks or gravel, and when the latter is flictous, fuch as may be found in the beds of rivers, the terrace will endure for ages. Bricks that have been throughly burned, and reduced to powder, answer as well as any fand, in the mixture of lime for building.

To lay a terrace, one parrah of broken bricks, one parrah of chunam, and five pollums of jaggary, diffolved in good

water, and mixed together, is called jelly.

Lay this jelly to the thickness you require; for the roof of a house or choustry, it is commonly not less than fix or more than twelve inches thick, and beat it with the trowel till it comes even on the surface, and then rub it with wooden trowels, and frequently moisten it with jaggary water sprinkled upon it (or poured) for several days, continuing the rubbing till it is sufficiently consolidated.

This is afterwards coarse chunamed, with a mixture in the following proportions; one parrah of chunam, one and a half parrah of sand, and five pollum of jaggary, and lastly fine chunamed, either for terrace work, or to contain water, as a tank or pond, —Grind four parrahs of chunam, and one parrah of chrystalline fand together, and mix with the mass five eggs, three pints of tyre, and five pollum of ghee.

N. B. I have found oil of fefamum, and other expressed

oils, answer as well as ghee,

While this mixture is applying, five pollum of the lapis ollaris (Balpum of the Tamuls) is duited upon it and worked into it with

the trowel-the polishing is finished as beforementioned.

It is worthy of remark, that where a wall is constructed of great thickness, and faced with stone, which leaves great and irregular inequalities on the inside, they fill up the heart of the wall by pouring in the abovementioned jelly, an art probably imported into Europe by the Romans; but lost again by the barbarous tribes who subverted the Empire: as I have seen a place on the water of Leith,

in Mid Lothain, called Lennox Calle, on the effate of John Scott, of Millenie, which has been constructed in the fame manner.

The theory of the whole subject however, may be collected from the experiments of the Honorable Mr. Cavendish, on limefrom, published in the philosophical transactions; and the subject farther elucidated by Doctor Black, in his researches into the na-

ture of li ne-water.

The arc being preferved here, is a proof, either that this country has never been entirely conquered, or that the Conquerors have been less favage than our Progenitors,—much however may be attributed to the anti-pity and fixture of casts amongst the Indians, in accounting for the preservation of their manners, customs and arts.

Question 6:b .- In what proportions do they mix the chunam

and fand together?

Anfaver 6th .- Vide answers 3d, and oth.

Queffin 7th.—What is the reason of buildings decaying so soon in this country, in which lime has been used as in Europe, with-

out the addition of the Indian ingredients?

A freer 7th.—Quick-lime is so powerful an absorbent, it cannot cease to at till it is faturated, and the pabulum is supplied more directly by mixing the Indian ingredients, than the external contact of the atmosphere will admit, in the European method, by the absorption of fixed air.

Question 8th.—Do you make any particular addition when you for n works that falt or fresh water is immediately to cover?

A fwer 8th, -Nothing more than that an encrease of the ingredients is held advanta goods in all cases, especially in works that are to lye under water.

Question 9:b.—Do they wet the mixture of lime and fand for forne time previously to the addition of the other ingredients?

Arfaver 9th.—The mixture of lime and fand is only moiftened with water while it is beat in a trough of granite flabs, with the pilum of wood, fornetimes flood with iron; an operation that may half fome hours, and the mixture is generally removed in wicker balkets, to the workmen, as foon as it is judged to be fufficiently beaten.—But I have known the fine chunam mixture of lime and find, preferved moil and foft, under water in a tank, for feveral days, till fuch time as the wall where it was intended to be laid was efteemed thoroughly dry, and afterwards applied as effectually as if it had been recently made.

EXTRACT OF A LETTER FROM JOHN BRISTOW, Esq. Dated, May 22, 1794.

To JOSIAS DU PRE PORCHER, E Q.

WAS favored with the duplicate of your letter of the 9th April last, the original having miscarried, and immediately applied to Sir John Shore, respecting the shawl goats. Sir John expressed his great respect for Doctor Anderson's character, and would have been extremely happy to comply with his request, but the goats were procured by order of the Directors, for the purpose of being fent to Sir John Sinclair; their arrival here has been reported home, and the Court adviced that they would be dispatched to England by the first ships which may fail in the proper season; under these circumstances, Sir John Shore thought he could not with propriety intrust the delivery of them to Sir John Sinclair, to any other hands than the Court of Directors. Colonel John Murray, and o. ther gentlemen here, have been competitors with Doctor Anderfon, for the honor of being the channel for prefenting the goats to Sir John Sinclair, and were refused on fimilar grounds; I trust this explanation will prove fatisfactory to Doctor Anderson.

Some of the goats have died; but to compensate three deaths, more have been born of the genuine breed; so that I hope a sufficient stock will be preserved to make the intended experiment

in Scotland.

In confequence of my refidence at the court of Owde, I have numerous acquaintances in the upper provinces, and will endeawour to procure fome more goats, if I fucceed they shall be fent to Doctor Anderson.

To SIR JOHN SINCLAIR, BART.

DY Captain Curtis, of the Swallow Packet, I fent you a ram, with fix horns, from Mount Ararat; and by Captain Chatfield, of the Rodney, another of the fame breed, with four horns, which I hope you have safely received as the third, likewise prefented me by Shamir Sultaun, is since dead, but this is of less confequence, as I now see by Trusser's habitable world, that Pallas sound this many horned breed amongst the Tartars in Siberia, so that in case they should appear an object worthy the attention of your society, they, may be more readily procured by the way of St. Petersbourgh. In my last letter of February 20th, Imentioned on the information of Doctor Roxburgh, the arrival of 18

shawl goats at the botanical garden in Calcutta, which I conceived might have been procured for you at the instance of Colonel Kyd, at any rate I was convinced that the death of this gentleman prevented proper notice being taken, otherwise they would have gone on the Rodney, or some of the ships which failed at that time.

As the preservation of these goats appeared to me an object most worthy the attention of your pursuits; I requested Mr. Porcher of this place, to sollicit Mr. Bristow, that they might not remain longer in the hot climate of Bengal, than necessity obliged; and have the honor to enclose a copy of his answer, which I hope will prove satisfactory.

JAMES ANDERSON.

Fort St. George, June 11th, 1794.

To JAMES ANDERSON, ESQUIRE.

THE Minister of this Court, Azeem ul Omrah, having heard of the progrets you have already made in the rearing of Silk-worms, and of the extensive benefits that are likely to accrue from the further profecution of your design, is extremely anxious to introduce through your means so valuable and beneficial a branch of manufacture as the filk one is

likely to prove, into his master's dominions.

With this view he is defirous of procuring the eggs of the worm, together with every possible information on to extensive and interesting a subject; and as he is well aware that the superintendance of a person well versed in the various branches of the business, would tend greatly to accelerate as well as facilitate the undertaking, he has requested our refident at this court, to use his endeavours to procure a competent person to whom every possible encouragement will not fail of being given.

As my brother has not the happiness of a personal acquaintance with you, I have readily undertaken to supply this deficiency, under conviction that your complaisance, and active benevolence will not only induce a ready compliance on your part, (as far as may lie in your power) with the above requests; but also lead you to see and approve of the motives

that actuate me to become the channel of them.

Two skains of raw Silk, made at Vellore, and now in my possession

possession, have been much admired here.—The Mulburry tree thrives very well, and at the same time is, I believe, tolerably abundant, in this country.

JAMES ACHILLES KIRKPETRICK.

Beder, 2d July, 94.

To CAPT. JAMES ACHILLES KIRKPATRICK.

I am very happy to be acquainted by you, for whom I have a fincers regard, that there appears a disposition at the Court of Hydrabad, to introduce the Silk manufacture, the success of which in any climate of Hindottan cannot be doubtful; and Beder, where you now are, appearing the native country of the vine, must be favorable to the mulberry.

For the most adequate information in my power, I enclose a copy of all that I have published on the subject, and will not only suppy you by the tappal, with eggs myself, but likewise defire Mr. Wilson at Guntoor, who is so much nearer, to rear

and forward you a breed.

Could you persuade Capt. Robt. Mackay, who is with Major Roberts's Detachment, to pay you a visit, he can explain any thing that may appear obscure in my publications, and is able to assist in speedful arranging every thing needful for rearing the worms, and laying our plantations of mulberry.—The two skains of Silk you so much admire, must be of his manufacture, while he was on duty at the Fort of Vellore.

I can only fay farther, that if you will take the trouble to fend any of the people here, who are to be employed in this business, I will order the fervants to show them the whole pro-

cess, as it is carried oh in my garden.

IAS. ANDERSON.

Fort St. George, 16th July, 1794.

To Captain PAKENHAM, of his majesty's ship resistance.

HAVE the pleasure to send you three entire copies of my publications for the improvement of this country, in hopes that you will do me the honor to enclose one of them

to the Biftop of Landaff, who I believe is the learned and elegant Dr. Warfon; another to Mr. More, Secretary to the Seciety for the encouragement of Arts, and that the third may contribute to your own amusement, in the fine weather

of the Indian Seas.

In case you write to these gentlemen, as I wish you may, let them know that West India Plants will thrive on any part of this coast, and I have this morning received a letter from Captain Read Collector of Barra-mall, of which the following is an extract; which you will be so good as communicate to them, as a commencement to the introduction of the productions of the high Latitudes.

"Allow me to trouble you for as many more feeds, to give Doctor Ord, who has been so good to take charge of a finall, but seemingly excellent foot, for the cultivation of Exotic Plants; on the top of the Rock of Kistnagurry, which may be sufficiently supplied with water all the year round."

As you have so attentively made an offer of your services, and expect to return here in December, which is the most favorable season for putting plants in the ground, besides Cloves and Nutmegs, which we have never yet been able to obtain; I have taken the liberty to enclose a list, any of which will be acceptable from the countries which you may visit.

JAS. ANDERSON.

Fort St. George, August 13th, 1795.

TO DOCTOR ANDERSON.

I have had much pleasure since my arrival here, in visiting the mulberry plantation in this neighbourhood, which is in a very flourishing way, tho' not so extensive as I expected to find it; the trees are so luxuriant, that they will yield several thou-fand cuttings, which might be very advantageously planted, at this season, as the hot land winds are now over, and we may expect constant refreshing showers for some time to come; no place is more adapted for the extention of Mulberry plantations than Guntoor; the soil feems savorable to vegetation in general, and there are abundance of wells, from which a plentiful supply of water can be had at all times of the year.

I should think myself wanting in that respect which I owe you, did I not see forward to offer my services to superintend the plantations here (which were originally under the care of my predecessor, (Mr. Mackenzie) and to extend them as far as may be thought necessary; I am the rather stimulated to this,

feeing

feeing that so many of my cotemporaries, professional men, have had this office intrusted to their care; and should feel much hurt, were it supposed I was not equally zealous to promote

a matter of fo much public utility.

I would not have addressed you on this subject at present, knowing that you had declined any farther interference in the business, were I not enclined to hope, that you may at a more favorable period re-assume your correspondence with government on this subject; and ultimately complete what your indefati.

gable exertions have already fo far effected.

I have read with much attention all your late publications, on the introduction of the Silk manufacture, and the cultivation of the bastard cedar tree, sugar cane, &c. &c. and should be much gratified, were it in my power to aid you in your laudable endeavours to render the propagation of these plants general throughout the country; I am much inclined to think the sugar cane would thrive well here; the soil is a light red earth, with a mixture of loame; in some parts water is plentiful and the villages abound with rich manure.

The feed of the Baftard Cedar, which you have already fent up here has not fucceeded under Major Wynch and Mr. Ram; I would have much pleasure in giving it a trial, and think the season now more favorable to it than it was two months ago.

I have made a purchase of a piece of ground, which it is my intention to form into a garden, where I shall plant all forts of plants, indiginous and exotic, such as country greens, cabbages, turnips &c. and shall be very happy to give the bastard cedar a place amongst them, if you will favor me with a few of the cones by the Tappal.

GEORGE WILSON.

Guntoor, July 18th, 1794.

TO DOCTOR ANDERSON, MADRAS,

I received your obliging letter, and was much pleafed with the account of your method of using chunam; it is much more simple than ours, and for terraces it appears to be preservable in every respect, whether it is also to be preserved for tanks and aqueducts, I cannot take upon me to judge.

I should perhaps have told you in my former letter, that I was anxious for information on the subject of chunam works, as Sir

Joseph

Joseph Banks has expressed a great desire to me, to be made acquainted with the art, I have written him all that I could learn on that subject; I had unfortunately fent away my letter to him before yours came to hand, for I found that I had been telling him some things that were not strictly true; I told him for instance that our method at Bombay was with little variation the practice all over India, I judged it therefore right to send him a copy of your account, which will be very acceptable to him; of this I hope you cannot disapprove.

I fent Colonel Floyd's Memorandum to my freind Mr. Small, Surgeon of the Company's Factory at Grain .- In a letter which I got the other day, dated June 24th, he fays-" I shall be happy to do what I am able to fufil Doctor Anderson's wishes, I have at or presenta horse that would highly gratify him, if the circumstance of his being a gelding is not against him; he is two years and a " half old, 14 hands and an inch high, of a roan colour-a more . highly bred animal has not been feen in this part of the world; he of is of the true Chylani or Kylani breed, as the Arabs call it; of which I take to be the Cochlanicf Neibhur, as the Bedowin Arabs 66 here have never heard the name cochlane, I purchased two horses from the Bedowins in the winter, when a great Hord of them were in this neighbourhood.—The other horse is also of a very " high breed, a guelding, he is four years old, of a forrel colour, and " large fize, 15 hands and an inch high; he is of a strong make and " runs very fast, I think he would be liked by an officer in the field .- I propose to send you them both to Bombay, if I can pro-" cure a passage for them, where you may be determined by the best " judges whether it is worth while to fend one or both of them to " Doctor Anderson."-I shall be glad to hear from you, respecting those horses; and whether I can do any thing farther for your friend Colonel Floyd; I am no kind of judge of horses myself, nor shall I fend them till I hear farther from you, and receive the approbation of the judges here—on this occasion I am convinced that Mr. Small will not wish to make any thing by his horses.

We have this feason two considerable and flourishing plantations of sugar-cane in Salfette, and we have reason to believe that the island of Jamica is not better fitted for that produce.

I wish to get for Mr. Rivett, Chief of Salsette, some seeds of the Mauritus Cotton; we have heard that a plantation of it has been lately attempted at Madras, with great appearance of advantage, and we wish to try it here.

We have lately found on the hills of Salfete plenty of the Nerium, that gives indigo; as a great part of the island is Mountainous and unfit for any other cultivation, we are thinking of raifing that plant on a large scale; I am aware that it does not yeld the colouring matter like the indigo-sera, by fermentation; but we have on our hills plenty of sirewood for the trouble of collecting it; you would much oblige me by letting me know what success has attended the attempts to manufacture it in the Carnatic, whether they have cultivated it, or only collected such as is found wild? and lastely on what plan they have constructed works for such a manufacture, with warm water?

I am still obliged to trouble you farther, but I hope the motive will excuse me,—you know that Surat is one of the most populous towns in india, and contains a great number of Parses; these people from the border of the Caspian, still retain much of the vigor of a more northern land, they are poor and industrious, and being free from many of the prejudices of the Gentoos, they soon embrace any employment

by which they can improve their condition.

Mr. Cherry of the Civil Service, now flationed at Surat, has expressed to me a wish of teaching the Parsees to raise the filk worm, as you have done in the Carnatic; he has written to Bengal for the worms, but has never been able to procure any from thence; can this be the consequence of a wretched policy, which prefers one spot of ground and one set of men, to the general weisare of mankind?

Mr. Cherry is a man well qualified by his abilities and from his fituation, to make such a scheme succeed—we shall be greatly obliged to you for your opinion, on this subject; and for the silk worms, if you approve of a trial of them.

H. SCOTT.

Bombay 25th August, 1794,

To JAMES ANDERSON, ESQUIRE.

I SHOULD long ere this have acknowledged the receipt of your obliging letter of the 16th ultimo, together with its valuable enclosures, had not the daily expectation of the eggs you announced, induced me to defer my acknowledgements till the period of their arrival.

My brother has communicated to the minister your kind offer of assistance, to any people he may send to Madras, for the

neceilar

necessary purpose of acquiring a competent knowledge of the various branches of the silk business; and he is accordingly looking out for an intelligent capable person, to depute to you, on that errand-he has likewife iffued directions for the cultivation

of the plant, in various parts of the country.

The two skains of filk so much admired here, were, as you gueffed, fent me by Captain Mackay, from whom we expect to derive material affiftance, whenever a convenient opportunity may offer for his paying us a visit; but this, independant of other circumstances, our distance precludes, at prefent.

The fruit of all the mulberry trees, I have feen here, is full two inches long, but by no means proportionably thick-pray is this kind of mulberry tree favorable to the filk worm? The late Doctor Binny, and several other gentlemen received, I understand, large supplies of slips from

Hydrabad.

JAMES ACHILLES KIRKPATRICK.

Beder, August 17th, 1794.

TO CAPTAIN JAMES ACHILLES KIRKPATRICK.

am favored with your letter of the 17th Ultimo, and am tavored with your record of the full amount amount confider the fubject of too much importance to delay a moment

writing in answer.

It will be very fortunate if the minister takes care to see his orders for extending the mulberry plantations put in execution; for this once established all the rest is easy-Women and Children should be immediately intertained in sufficient nuo.bers, to take care of as many worms, as you may be able to find leaves to feed.

The filature may afterwards be established by abundance of hands from hence, as feven able workmen are just lan-

ded from ben al.

There are no Experiments necessary; the business requires only to be put in execution, and I will supply you with every thing needful, to accomplish fo great a purpose, with p'eafure.

The mulberry, with fruit two inches in length is the great China Paper Mulberry, and most worthy your atten-

tion.

tion, as they may be reared as standards, and will yield abundance of succulent leaves, without farther care, whereas the other Mulberry, which you have at Hydrabad, of which Captain Kenaaway sent Mr. Binny a great many slips, is very inferior, the leaves soon getting hard and woody and unit for the use of the worms; encourage the Minister, therefore to direct his attention to the culture of that best kind.

The Bengal workmen, in passing through my garden on their way to Vellout declared with one voice, that my little establishment of filk was perfect in all its parts, and during two days that they remained I could only hear of one thing which they objected to: observing my people gathering the leaves at noon, They very sensibly pointed out the slaceid state of the leaves, after the influence of the sun was powerful, on which account I have directed the leaves to be gathered at day break.

JAMES ANDERSON.

Fort St. George, 2d September, 1794.

To JOHN LAIRD, Esq.

PRESIDENT OF THE HOSPITAL BOARD, CALCUTTA.

THIS will be delivered you by Mr. Sonnerat, who is about to leave this place for Bengal.

Mr. Sonnerat is fo well known, in the literary world, by his valuable publications, it will be needles for me to fay more, than thathe is a person for whom I entertain a fincere regard, and will esteem the obligation of your showing him every countenance and attention in your power, by introducing him to the notice and acquaintance of Sir John Shore; or such persons as may be able to promote the favorite purfuit of Natural History, and Agriculture, in which he follows the steps of his uncle, the great Poivre.

JAS. ANDERSON.

Fort St. George, 6th September, 1794.

To JAMES ANDERSON, Eso.

I have the satisfaction of transmitting you a copy of my translation of the Sanscrita Almanac, for the present year Aunanda.

This copy is executed by fome unfkilful writers, yet have ing examined and marked the fame, word for word, from the beginning to the end, the readers may read it over without hefitation, by retaining in memory the marginal notes and the contents of the prefatory letter to my faid translation.

Be it known to your goodness, that in the beginning of the Sanscrita and Zamilion almanacks (written upon palmar leaves) the lord of the year and the politional influence of the planets, and also the image of the God of Tekupha, are stated by way of preambles which I have not yet translated, for want of leifure, but shall fend to you with an explanation of the technical words occurring in my translation of the Sanscrita Almanac.

T. MOOTIAH.

22d September, 1794.

To JAMES ANDERSON, Eso.

WAS this morning favored with your packet of filk worm eggs in perfect order, and have the satisfaction to inform you that fince the commencement of this business, nothing has given one more pleafure than the net you made for feeding the filk worms, from the expense and labour which must be saved by the use of it, which the Bengal people, evidently prepoffessed, condemned, till forced into the acknowledgement of its utility by my useing it in the care of some worms I took under my own charge but to do the people justice, though they found fault with it at first, they now feem much pleafed with it, and in my opinion it must leffen the charges attending the care of the filk worms at least 30, if not co per cent.

BOSWALL PARKISON.

Vellout, September 27th, 1794.

To Mr. BOSWALL PARKISON.

AM favored with your letter of the 27th, and am not furprised at the opposition of the Bengal workmen to the use of nets. 53

nets for shifting the worms from their liner, as it is probable the worms are attended by so many people in that country, that any expedient to lessen the labour has never appeared necessary, and it must be allowed that like all the world they are wedded to what they have been accustomed to, for when I first erected the improved reels, my Bengal people infifted that every one of them would require two men at the handle to turn them. but when they afterwards faw that a child who could only reach the handle turned the reel, with three times as much velocity as the reels used in Bengal could be turned, and that the quality of the filk was capable of bearing the rapid motion, the Eengal workmen feized them, and would never afterwards work on any other.

In Bengal the rearing of the worms is altogether the bufiness of the country people; the houses are small, and in close moist weather the air is liable to be tainted, so as to kill fometimes the worms in a whole district in a single night, which they ascribe to the machination of the devil, so that it is probable they can be of little use to you in rearing the worms; but when you get fo far as to wind filk, you will find their expertness, arrangement, and method practised at the file.

tures in Bengal of infinite consequence.

JAMES ANDERSON,

Fort St. George, September 30th, 1795.

To DOCTOR ANDERSON, P. G.

70U have greatly obliged me by your favor of the 18th I instant enclosing the copy of a letter from Mr. Scott, at Bombay, which is throughout curious, but contains one paragraph particularly interesting to me, extracted from a letter of Mr. Small, furgeon to the Company's Factory at Graine, on the subject of Arabian horses, of which I profess myself a very great admirer.

With regard to the horses, this has all the appearance of being the right road, and it is probable Mr. Small has the most favor-

able opportunities of procuring some of the best.

I do not wish to have a gelding and am defirous of having one or two horses old enough for immediate use-that is not under four years old, nor do I wish to have one upwards of eight years old .- These horses should be of the greatest strength that can be found, combined with activity, and as I know the Ara-

D 2

bian horses are seldom of a large size, I should be well fatisfied with horses of sourceen hands and three inches, or sourceen hands two inches high.

If a horse of extraordinary power should be found only fourteen hands one inch high, I should still be fatisfied—colour

immaterial.

The best Arabian horse I ever saw was exactly fourteen hands two inches, he belonged to Count Alexis Orlow, who received him as a present from the famous Ali Bey,—Count Orlow received his Pedegree along with him, he was warranted of the true Cachlani race—thus Count Orlow pronounced it when he spoke of him in Italian; he called him Cochlianer, when he spoke in German—Niebhur, I see calls the race Cochlani,

I made an enquiry of your friend Doctor Russell, when I had the good fortune to meet him at your house fome years ago, as he had resided at Aleppo, concerning this race of horses, and he took the trouble to search his notes on the subject; he told me the most famous race of horses among the Arabs, was by them called Cocklyon, and I conclude after making allowance for arbitrary orthography, and something for difference of pronounciation; the Cochlani, Kylani, or Cocklyon, to be the same, or at least to mean the same.

The Arabians acknowledge one race of their horfes to excel all others—Count Orlow communicated to me their history or fable of this race; which according to them drew its origin from a horfe of divine beauty that arefe from the fea, and covered a mare of very great fame, I think it was faid this horfe was

white.

The temper of the Arabian horses is one of their valuable qualities, in which they greatly excel, so that they never bite, kick, start, or quarrel, but are the gentlest of animals, possessing however the most sery spirit when called upon and urged to exertion, and this spirit is never known to slag, as happens to other very promising horses—however the bottom of Arabian horses in general is very remarkable, and many of them seem to be almost incapable of fatigue.

I have heard that the Arabs efteem a quality in their horfes, very valuable to them, though of no use in Europe—they say that their horses will travel several days without water, and almost without

food

It would be highly interesting if Mr. Small would make some enquiry into the history or even sable of the Arabian horses, and collect some of their accounts of the performances of their samous

horfes:

horfes; their speed, space gone over, length of time without water, or food, their manner of feeding, airing, and exercising

their horses.

It would certainly be doing me a very effential fervice, if by your influence and that of Mr. Scott, Mr. Small could be prevailed upon to procure me one or two horfes of this breed, fo much efteemed by the Arabs, of sufficient firength to carry me and my tackle; I should pay with pleasure the sum Mr. Small named up to sive hundred, or even a thousand pagodas, for a horse thought by the Arabs to be worth it.

I have no doubt if Mr. Small was inclined to speculate, but he would receive very high prices for horses really good, sent to Madras for fale,—he would do a great public service if he could find means to procure annually a number of good horses for the use of our cavalry, and I would gladly make known every thing he might be inclined to propose on this subject,—excuse my Dear Sir, the liberty I take in troubling you and your friends, so much at length, but you see to what your known kindness exposes you—my transplanted bastard cedars are thriving prodigiously, your young Adansonias shall have a spare spot.

JOHN FLOYD.

Trichinopoly, September 28th, 1794.

To DOCTOR WILSON,

AT CUNTOOR.

SOMETIME ago I received a letter from you, regarding a defire to promote the objects of improvement which I had recommended, but nothing worthy your attention preferting at the time, I have hitherto found it unnecessary to trouble you with an answer, believing you would be satisfied I was not in-

fensible to your obliging communication,

The court of Hydrabad having however fignified a defire to introduce the filk manufacture into their possessions, induces me to inclose some to inclose some to inclose some to inclose some soft mulberry leaves sufficient to rear a breed, and forward the produce of the eggs to Captain J. A. Kirkpatrick at Beder, near Hydrabad, which will ensure their getting them in good condition better than I can at this distance.

JAMES ANDERSON,

Fort St. George, September 11th, 1794.

To DOCTOR ANDERSON, P. G.

Arcot. Odober 1ft, 1794.

HAVE great fatisfaction in acquainting you of the very flourishing state of the bastard cedar in the several gardens belonging to the officers of this cantonment, which thrive in a most astronishing manner, and I have not a doubt but in the course of a few months they will be yielding seeds for extending the cultivation of them farther.

As I dedicate my leifure hours folely to the rearing of trees and shrubs, I hope I shall not trespass on your goodness in the requisition of a plant of the bread fruit tree, or any other exotic.

you can conveniently spare.

The quantity of rain which has fallen in this part of the country, makes its appearance very beautiful, and should you be induced to make a trip thus far, I shall be very happy, and endeavour to make your stay as agreeable as possible.

WILLIAM YOUNGE.

JOHN HOYD.

To DOCTOR ANDERSON P. G.

A CCOMPANYING I have the honor of fending the first four so our labours for your inspection, the produce of rooc Caccons, a compliment due to you as patron of the Manufacture, and beg leave to return my most grateful thanks, in behalf of the concern, for the Filature-men you were so good as to spare us, or our cacoons must have been bot; and you need not be surprized, if I should fend you a quantity to reel off, as the fire ruins all our brick-work, which is not yet dry.

A BLACKADDER,

postni

Mulberry Plantations, near Poonamalles, October 14th, 1794.

To DOCTOR ANDERSON, P. 6:07

I HAVE taken the liberty to fend you four baskets of Cacoons, the produce of my Bungalow at Voyalore, and beg the favor to place them under your direction, to wind up, and dispose of as you may think most proper.—I have great hopes in a short time, to be able to fend some white silk cacoons for your inspection.

This

This business has been particularly expensive to me, having engaged in it for the Public good, and the Honble Company's future welfare; I am encouraging others to pursue this laudable undertaking, and have no doubt, there are many that would, could the obstacle of rent be removed; and I am fully persuaded, should this be the case, that the Honble Company would, in after times, be greatly benefited by it; as this would be a fure plan to extend the manafactory upon a large and open scale; and then considerable profit must inevitably succeed, and would handsomely repay the Honble Company for any encouragement they may think proper to give.

VERA PERMALL.

Madras, 16th October, 1794.

To VERA PERMALL PILLY,

AM favoured with your letter, and the cacoous, which appear very good, notwithstanding the present wet season is

unfavorable to the worms.

As I am fensible of your laudable intentions of encourageing others, I have ordered the cacoons to be wound off, and now fend you by the return of your fervant, the produce, amounting to eighteen skains, about a pound weight in all, that you may shew those who are disposed to the undertaking, the completion of the work, which I hope will likewise encourage you to establish a Filature of your own, as no great

addition to the expences you have already incurred.

You know that after demonstrating the average value of the Company's Lands, cultivated and waste, to be no more than one shilling a cawnie, or eight pence an acre, the Government were pleased to adopt the idea of renting the waste lands at four shillings an acre, no doubt because it would multiply the revenue six fold, and prove a much greater advantage than any manufacture could they so rent it out; but unfortunately since it appeared that their arrangement was only a monstrous scheme of encreasing the rents on paper, no one has come forward to occupy waste Lands.

As they have, however, made a Plantation at Vellout, at the Honourable Company's expence, where they are now winding filk, they will be able more adequately to value the lands.

JAS. ANDERSON. Fort St., George, October 16th, 1794.

TO DOCTOR SCOTT, BOMBAY.

A S foon as I was favored with your letter of August 25th, I enclosed a copy to Colonel Floyd, and have now the pleasure to forward you his answer which, I have no doubt, you will think of importance enough to transmit to Mr. Small.

Had I known your wish to communicate with Sir Joseph Banks, I could have said nothing more to the purpose regarding chanam, excepting that perhaps the various modes of workmen in obtaining the same end, may be considered a difference—as, in tempering steel, every workman has his own method, although the tempering of steel may depend only on one principle—the due proportion of heat; and the instantaneous saturation of lime, on the application of such substances as will speedily supply the aerial acid, for rendering it mild and fixed.

I might have told you, for example that although the last coating of fine chunam, which is always very thin, and little more than a surface exposed to the air, is prepared by mixing it only with pure chrystalline sand, yet that I had seen some workmen mix a small quantity of oil of sesamum, and even vinegar, in

the preparation.

I might have stated, likewise, that the work applied to cisterns and aqueducts, where the foundations are securely laid, is as capable of containing water, as Marble is; and after the work is confolidated, our Puildings of Brick, being struck with violence such as the blow of a stedge hammer, will not break in the direction of the cement, but only in the direction of the force.

I have been thus minute, in hopes that the learned Prefident, who has devoted an ample fortune, and the vigor of life, to the most commendable uses of public economy may influence all Europe to construct buildings of duration, and enhance the value of our West-Indian Islands, by the consumption of sugar, for the saturation of which, there is great probability the Romans used honey, oil, blood, eggs, milk and mucilages, in the construction of their works.

The Nerium Tinctorium likewise grows in great abundance, on all the hills in this Country; and I understand, that the Calico Painters, both here, and in the Eastern Peninsula, use it in

their processes.

Doctor Roxburgh told me, that some colour which he prepared from it, was valued in Bengal, at seven shillings and six pence the pound.—Mr. Roebuck found, that the colour of it was obtained better by the cold than the hot insusion, but I do not hear, that any considerable plantations of this tree, have ever been

made, the latter gentleman having favored me with a drawing and description of his Indigo Works, in this neighbourhood, I have the pleafure to enclose them, for your fatisfaction, and think that the Indigo-fera, being more eafily collected, and yielding the most brilliant colour, is the only thing of the kind, that will

defray the charge of expensive works.

Both the Roebucks are able Chymists, and expert Artists: they have erected a steam Engine, that acts with a force of two tons and a half, for pumping water, and driving the beaters; they have likewise laid cylinders, pierced with holes, in the bottom of the vats, for the transmission of a blast of air; which renders the former practice of beating less necessary, as by exposing innumerable furfaces of the liquor to the air bubbles, a speedier, and more copious deposition of Indigo, than by the beating process, is obtained.

Although I was at the Capture of Surat Castle, in the year 1750, yet having had no opportunity of landing, I know but little of the place; but from what I saw at Bombay, have no doubt that the Parfees compose a confiderable part of the population:-The lower classes of the Hindoos, have no repugnance however, to working in filk, and the culture of the Mulberry is exactly the same as the culture of the Suger-cane :- cuttings of the same length may be placed most advantageously, at the same distances; and in ground that is fit to raise a crop of sugar-cane, the Mulberry will arrive at the greatest perfection, for feeding the Silk-worm.

Having had some overtures from Hydrabad, for supplying them with Eggs of this infect, it will be easy, in case this takes place, to transport a breed, by the way of Arungabad and Poonah, to your friends at Surat; and recommend you to request the Resident at Poonah, to plant a few Mulberries in his Garden; for the reception of the monthly Worm; the annual Breed, I

shall not fail to fend Mr. Cherry, by fea.

JAMES ANDERSON

To DOCTOR ANDERSON, P. G.

SHALL be extremely obliged, if you will be so good to I fend me the original description of the filk manufacture, which I am told, is printed in English and Malabars; and published by you some time ago.

It is the latter only, that I want, for a friend of mine in the country, who wishes to establish a mulberry plantation; and hope you will excuse the trouble I am always giving you.

VERA PERMALL.

Madras, November 2d, 1794.

To VEA PERMALL PILLY.

THE Letters I published, for the culture of filk, were translated into Malabars, by Mootiah, for whom I have much regard; but as by want of Types, I have not been able to get them printed, the Beaterwill deliver you the original Manuscript, for the use of your friend in the country; or in any way your better judgement may devise to render them of more extensive use.

JAS. ANDERSON.

November 2d.

To DOCTOR JAMES ANDERSON,

REVENUE DEPARTMENT.

I AM directed, for your information, to transmit to you the enclosed Extract of a Letter from the Honble. Court of Directors, dated 21st May last.

J. WEBBE, DEPUTY SECRETARY.
Fort St. George, 3d January, 1794.

Extract of a General Letter from England, dated 21st May, 1794.

Par. 53. THE directions contained in the 4th paragraph of our Revenue dispatch, of the 3d July last, sufficiently evince our earnest desire to afford every reasonable degree of encouragement to Doctor Anderson's endeavours, for establishing the manusacture of silk, on the Coast of Coromandel; and we shall chearfully consent to your rendering such pecuniary affistance to the undertaking,

undertaking, as shall give it a fair chance of success.—With refepct to what is stated in the 5th and 6th paragraphs of your Letter, in the Public Department, of the 28th February, 1793, concerning the charges already incurred by Doctor Anderson, in his laudable endeavours for furthering an object of so much utility, we can only say, that we are not only willing to discharge the amount thereof, but shall have great satisfaction in giving Doctor Anderson a more substantial proof of the sense we entertain, of his zeal and ability.

54. Of the famples of filk received by the Contractor, the following report has been made to us, that it is of good quatity, was admirably well wound, and if it is procurable at a rate of coft equal to what the article is afforded for at Bengal, it would

answer for sale, in this Country.

A true Extrad, (figned) J. WEBBE, DEP. SEC. Compared, A. FALCONAR.

To DOCTOR JAMES ANDERSON.

PUBLIC DEPARTMENT.

SIR,

AM directed, for your information, to transmit to you the enclosed extract of a Letter from the Honorable the Court of Directors, dated 28th May last.

(figned) J. WEBBE, Dep. Sec.

Examined, A. FALCONAR.

Fort St. George, 3d January, 1795.

Extract of a General Letter from England, dated 28th May, 1794.

Paragraph 6th—Having been given to understand, that Doctor Anderson had a wish of being supplied with a silk Reel, upon the most approved construction, and being desirous of giving that gentleman a proof of the sense we entertain, of his unwearied attention to the important object of introducing the culture and manusacture of this article on the Coast, we have procured from an artist of this country, one of a more perfect kind than has hither to been invented; in which, all the defects hitherto complained

of are supposed to be effectually guarded against.—It is laden on the ship Rose, and on its arrival, we desire that this may be presented to the Doctor, in our names, with a request, that after making a trial of its powers and effects, he will report to us, in what degree it is preserable to those at present in use; or whether any surther improvement can be suggested, for rendering it more useful than in its present state;—we apprehend, should this be found to possess any superior qualities, you may be able to cause a sufficient number to be made, after this model; or if you conceive any part of the mechanism to exceed the abilities of the native workmen to perform, upon indenting for such parts from hence, we shall take care you are regularly supplied therewith.

A true Extract, (figued) J. WEBBE, DEP. SEC. Compared, A. FALCONAR.

To THE RIGHT HONORABLE LORD HOBART, GOVERNOR IN COUNCIL.

MY LORD,

AM favored with two paragraphs of the general Letters from England, dated May 21st and 28th, last year; the first approving of the silk manufacture here, and the latter announcing a Reel, which, at the instance of my friend, Mr. Molesworth, the Court of Directors have done me the honor to send from London.

I am very fentible of the attention of government, in forwarding these Papers, as an acquaintance of the approval of what I

have had so much at heart, is very pleasing to me.

I have not been honored with any communication, of the fubject of the 5th and 6th paragraphs of the Government Letter, in the Public Department, under date the 28th February, 1793, to which the Honble. Court have reference, in the 53d paragraph of their general Letter of the 21st May last:—I am, however, led to believe, that a stateping representation was therein made, of my endeavours to promote an object of such public utility as the establishment of the cultivation of Silk on this Coast; and from the orders therein given to Government, to defray the charges incurred by me, in this undertaking, imagine you will not helitate to carry them into effect; in which case I shall make known to you the amount. In answer to the 54th paragraph of the general Letter, of May 21st, the Honble. Court must be sensible, that in the present stage of the business, and until the manufacture is in the hands of the natives at large, it would be premature and impracticable, to make any estimate of the cost at which the article may be

brought to market.

The only points requifite to be afcertained viz. the rapid growth of the Mulberry, and the goodness of the Silk, I have already demonstrated; and when the number of women and children, now idle for the most part of the year, are considered, and that the expence of their labour will be but little, in comparison with the quantity of cacoons which they may rear, when the Mulberry, as in Bengal, is cultivated by one fet of ryots, and the filk wound off by another, or at the Company's Filatures, it is impossible to say how cheaply filk may be manufactured, when the same, or something similiar, is effected.

The attention of the Honble. Court, in fending me a Reel, is very gratifying; whenever it is forwarded to me, I shall not fail to state my opinion of it; but my Reels, as now improved by a treble velocity, have been found to answer every purpose; and the simplicity of the double crossing machines, described in my letter to Government, January 21st, 1793, renders them

superior to any thing of the kind hitherto in use.

I am, MY LORD, &c.

JAMES ANDERSON.

Fort St. George, 26th January, 1795.

To DOCTOR ANDERSON,

PHYSICIAN GENERAL.

I HAVE to acknowledge the receipt of two letters from you; one dated from Vanimbady, the other from Madras, enclosing an Arzee, from Behader Sing, to Azeem ul Cinrah;—who will, I apprehend, very readily defray any encrease of expence, you may judge necessary, to the success of the undertaking, he having already applied to my brother, to furnish him with a credit at Madras, for that purpose. Behader Sing, it feems, recommends to the Minister, a considerable extension of the culture of the Mulberry Plant, as indespensibly requisite to the ultimate success of so extensive a plan as his.—Captain Mackay writes me, that he met, while at Rungpore, with an

uncommon

uncommon species of the Mulberry, which he has very confiderably transplanted to Hydrabad.—He describes it as a hardy-plant, quick of growth, and possessing great luxuriance of follage; properties that must render it very valuable, in the rearing of silk-worms.

The continued marching we have had, almost ever fince His Highness moved, with his army, from the vicinity of Beder, has prevented my answering your Letters so punctually as I should otherwise have done.

The numerous forces particularly of Horfe, composing the army I am with, have followed, hitherto, the windings of the River Maunjrah; for the convenience of water and forage; which its fertile banks supply in the greatest abundance and perfection.

The climate here, is nearly, I think, the same as that of Myfore; the nights and mornings, perhaps, rather keener; but the cultivation exceeds any thing I ever faw, in India, or indeed any where:-believe me, I do not exaggerate, when I affure you, that the whole face of the country from hence to Beder, a space of at least one hundred miles, by the route we marched, is nearly one uninterrupted fheet of wheat, barley, Jowarree, and other dry grains; -nor is this charming scene confined merely to the neigh. bouring plains, as the eye is regaled with the fame unbounded prospect of the happy fruits of industry, from the fummits of the few hills scattered along our routes; which, while it unquestionably bespeaks an adequate population, and a fertile soil, naturally leads one to entertain more favorable fentiments of the humanity and policy of the lords of it, than they have hitherto had credit for amongst us; or at least, may induce us to suspect, that they are not fuch inconfiderate rapacious tyrants, as we have generally been taught to confider them.

I have forwarded some papers of silk-worm-eggs, hatched at Beder, to Mr. Uthoss; at Poonah, with a view to transporting the breed gradually to surat; but as Sir Charles Mallethas removed from Poonah, with the Peishwa's Army, I am asraid your scheme must be postponed to a more propitious season; should we canton at Arungabad; this year, it will be a favorable opportunity to resume the attempt.

JAMES ACHILLES KIRPATRICK.

Camp at Hassunpoor, on the banks of the Maunjrah, 3d Feb. 95.

To THE RIGHT HONBLE. LORD HOBART, GOVERNOR IN COUNCIL.

MY LORD,

A CCOMPANYING this, I fend the particular account your Lordship seemed to wish; and leave it to your pleasure to settle as you may think proper,

I have the honor to be, Mr Lord, &c.

I have the honor to be, My Lord, &c.

JAMES ANDERSON.

Fors St. George, February 12th, 1795.

To DOCTOR JAMES ANDERSON,

AM-directed by the Right honorable the President in Council, to acknowledge the receipt of your Letter of the 12th instant, and to inform you, that the amount of your disbursements, being Thirteen Thousand three Hundred and Ninety-seven Pagodas, seventeen Fanams and twenty Cash, (13,3971720) on account of the introduction of the Cochineal and Silk-worm, upon the Coast, will be discharged upon application at the Treasury.

(Signed) J. WEBBE, Der. Sec.

R. SHERSON, Ex.

Fort St. George, 14th February, 1795.

To THE RIGHT HONBLE. LORD HOBART, PRESIDENT AND GOVERNOR, IN COUNCIL.

MY LORD,

THE patronage of the Honble. Court of Directors, for a Silk Manufactory, being decided by the refolution of your Board, on the 14th Inftant, I have the honor to acquaint you, that in confequence, I have drawn from the Treasury, for the whole of my expences, on that and other accounts, of improve-

ment, the fum of 13,397 17 20.

As the expenditure of this money, is of little avail, unless the light which has been thrown upon the subject is applied to use, your Lordship will be pleased to acquaint the Directors, by your first despatch, that hearing of no extention of the manusacture within their possessions, since the 22d February, last year, I have been induced to favor the idea of its introduction to the notice of every government

government in the Peninfula, of which, the Honble. Court, will not hefitate to approve, feeing the export must necessarily fall into our hands.

I have the honor to be, MY LORD, &c.
JAMES ANDERSON.

Fort St. George, February 19th, 1795.

To the right honorable LORD HOBART. MY LORD.

AVING requested Captain Mooney, to send on shore some Shawl Goats, I am forry to find that the two which have been sent, are so lean that it appears to me very doubtful they will live, till they reach St. Helena; considering the safe arrival of these animals a National object, I take the liberty of recommending that the goats on board the Goddard and Asia, be landed immediately, to recruit; and not forwarded to Europe, till the next sleet, which I understand, will sail in Aparil.

Captain Mooney fays, that the goats have fallen off aftonifh, ingly, fince they came here, and is forry they had not been

landed on their first arrival.

I am, My Lord, &c.
JAMES ANDERSON.

Gardens, March 3d, 1795.

To DOCTOR ANDERSON,

PHYSICIAN GENERAL.

I SEND you fix Shawl Goats, by order of the RIGHT HO.

NORABLE THE PRESIDENT IN COUNCIL, landed from
on board the ship General Goddard.

J. GREENHILL.

Friday Morning.

To DOCTOR ANDERSON, MADRAS,

BOTH your obliging letter, and the celebrated ram gog, reached me in fafety; I return you and your respectable Armenian friend my best acknowledgements, for so uncommon a speciment of

SECRETARIA PROPERTY.

of that useful animal. I expect the other with great impatience; I hope that it will arrive time enough to propagate the real ante-

deluvian race in England, even this year.

A very curious fact has occurred, in confequence of your fending me this theep; I had one from the illand of Gothland, in the Baltic, where there is a very pure race; to my utter attonishment, upon comparing the two sheep together, they were exactly the same in point of size, shape, wool, &c. only the 'wedsh had but four horns, and not fix, like the ram from mount Ararat; this circumstance tends to confirm the idea that the Goths came from Asia, as some historians have afferred; they would naturally bring their flocks with them; so that the same race might be found in the neighbourhood of Mount Ararat, and in the distant Island of Gothland.

You will hear with pleasure, that the British Wool-society is going on successfully; you will find in this packet, some specimens of our manusactories, and two waistcoat pieces, one for yourfelf, and the other for your Armenian friend, of which, I hope he will have the goodness to accept.

We are at present deeply engaged in an agricultural survey of the whole Island of Great Britain, the nature of which will be sufficiently evident, from the papers herewith sent: the whole will be compleated in about three months, and in nine months

from its commencement.

I hope that your spirited exertions, for the advantage of the valuable possessions of Great Britain in the East, are succeeding to your wish.

JOHN SINCLAIR.

Whitehall, 17th April, 1794.

To SHAMIER SULTAUN, ESQUIRE.

A HAVE the pleasure to enclose for your inspection, a Letter from Sir John Sinclair, with musters of stuff for Waistcoats, and accounts of the safe arrival of the Ram-gog in England.

I beg the favour of you to let me know your choice in the pattern.

JAMES ANDERSON.

Cardens, March 6th, 1795.

Mr.

Fort of, Let

To JAMES ANDERSON, Esq.

Mr. Shamier presents his best respects to Doctor Anderson, with a great many thanks, for his and Sir John Sinclair's very polite attention, and returns herewith the letter and famples, which last-he esteems all of them promiscously very good, and fuitable to his tafte, therefore begs leave to refer to the Doctor, that he will be pleafed to take first his choice.

It is a most satisfactory circumstance, indeed, to see such good produce from the industry of liberal minds, which always causes a great deal of benefit to the public, and flourishing of

the world.

Mr. Shamier takes the liberty to request of the Doctor, to be fo obliging, as to affure Sir John Sinclair of his above acknowledgements, and would have fooner returned an answer, had not the beauty of the specimens, made him keep them till he could show them to some friends who admired them much,

March 8th, 1795.

TO THE RIGHT HONORABLE LORD HOBART, GOVERNOR, IN COUNCIL.

MY LORD,

HAT the benefit of landing the Shawl Goats, from the General Goddard, may not be loft; I have the honor to acquaint your Lordship, that at an average of two Madras meafures daily, which is what we have found by experience, they will eat, I have provided a flock of the Bengal gram, carilley, and hay, to last them for fix months.

That an animal of fuch diversity of appetite, may be gratified with variety, as a means of preferving them in health, I have likewise cured a quantity of leaves, of three different kinds of trees, of which they are fond; the Rhamnus Jujuba, Mimosa Nilotica, and Theobroma Gazuma, some of which may

occasionally be mixed with the hay.

As the establishment of this breed, must prove of much confequence to the manufactures of Great Britain; your Lordship will readily fee the propriety of fending them to England, on one of the ships now under dispatch, to avoid any risque of the enfuing hot feason, I am, MY LORD, &c.

JAMES ANDERSON.

Fort St. George, April 7th, 1795.

TO THE EDITOR OF THE MADRAS GAZETTE:

A Sit appears, that from the raw cold feason which we have lately experienced, without fufficient shelter from the N. E. monsoon, the breed of filk-worms in this neighbourhood has been nearly destroyed, you will do me the favour to acquaint your correspondents that all those persons who are desirous of continuing to exert themselves in this way, may be supplied with eggs of both the yellow and white China monthly worm, by application to me, before the first of next month.

IAMES ANDERSON.

Fort St. George, April 13th, 1795.

TO THE RIGHT HONORABLE LORD HOBART.
GOVERNOR, IN COUNCIL.

STREET, STREET

MY LORD.

IT is with great pleasure, I have a second opportunity of evincing Abdul Wahub Cawn's zeal for promoting the filk manufacture, in delivering a specimen at his Excellency's request, of beautiful filk, lately made at Chittore, for the inspection of the Honorable the Court of Directors, not only on account of the late failure of the worms on this part of the coast, but also that a small specimen which it contains; is elegantly wound by a native of that place.

My garden having been lately supplied from this plantation, so as to enable me again to stock Vellout, Poonamallee, &c. with a sufficiency of eggs, will demonstrate the propriety of my having introduced the manufacture into different parts of the country, as accidents which happen to this infect in a similar manner every where from bleak winds, may be remedied without loss of time.

I have the honor to be, &c.

JAMES ANDERSON.

Fort St. George, April 14th, 1795.

To DOCTOR JAMES ANDERSON, P. G.

THE Right Honorable the President in Council, who is fensible of your attention to the Honorable Company's Shawl Goats, directs me to acknowledge the receipt of your Letter.

ter, dated the 7th instant, and to inform you that Captain Craig, of the Queen, has been ordered to receive them on board of his ship, and to be mindful of such instructions as you may judge necessary to send, for the care and preservation of them.

J. WEBBE, SECRETARY.

Fort St. George, 11th April, 1795.

Ex. R. SHERSON.

To CAPTAIN MILLIKEN CRAIG, OF THE SHIP QUEEN.

AM directed by the Right Honorable the Prefident in Council, to defire that you will receive from the Phylician General, Doctor James Anderson, six Shawl Goats, which upon the arrival of your ship in England, you will dispose of according to the orders which you may receive for that purpose, from the honorable the Court of Directors.

Doctor Anderson has provided a sufficient stock of provision for them during the passage, and has been authorized to furnish you with such instructions as he may judge necessary, for the care and preservation of them, which you are hereby required to observe and obey.

J. WEBBE, SECRETARY.

Fort St. George, 11th April, 1795.

Ex. R. SHERSON.

To SIR JOHN SINCLAIR, BART.

I WAS favored with your letters of April and July, with the reports which you fent by Mr. Cleghorn, who on this and every other account, will always merit my best regards to his welfare.

The Edinburgh Manufacture has been admired, as you will fee by Mr. Shamier's note on the specimens of intended waithcosts, which I inclose, and the attention of my Armenian friend, will farther appear by a bena iful ram, from the province of Hearivan with wool entirely white, which Captain Craig of the Queen, has taken charge of for you.

The attention of the Court of Directors, in ordering Shawl Goats from Tibet, as it may greatly tend to introduce manufactures of this delicate substance into our Island, will not escape your notice; some that were fickly in the late Ships having been committed to my care, are now shipped by government on board the Queen, India nen, in good health, and I have the pleasure to inclose you my correspondence regarding them.

At first fight they appear like Welsh goats, both body and limbs being covered with long shaggy coarse hair; but besides the sine down or matter of which Shawls are made; what distinguishes them from other goats, is the divided state of the Scrotum. mak-

ing the Tellicles separate and distinct appendages.

The Shawl is a very delicate and thin matting of down, on the furface of the fkin, among the roots of the hair, and I have only been able to find it on the younget, or half grown goats, not only in the natural flate which I have mentioned, but likewife falling off in small flocks, and entangled among the hair, which

may be owing to their long stay at Calcutta.

I have read fome of the reports made to the Society in which you fo commendably prefide, with great attention, and am fatisfied, that from the public injury which appears by land lying nearly waste in commonage, it must be the wish of every well disposed person that they were appropriated and inclosed, after just compensation to those who have hitherto enjoyed the pasturage and use of such lands.

Here a much greater proportion of land, comes under this difcription than in England, and if ever a reasonable mode of appropriating them is adopted, the improvements, I have hinted at, may be spread over the country with much public and private ad-

vantage.

JAMES ANDERSON.

Fort St. George, April 23d, 1795.

To JAMES ANDERSON, Esq.

AM favored with your letter of the 15th instant, accompanying the eggs of the white and yellow filk worm, they came perfectly fafe, and will I hope put foon another face on the business here, and an end to my uneafiness at feeing such fine foliage as there is at present on the Plantation remaining useless,

The flannel and wax-cloth the bearer takes with him.

BOSWALL PARKINSON.

Vellout, April 16th, 1795.

70

To JAMES ANDERSON, Esq. P. G.

AM honored with your favor, accompanied with a most feafonable supply of filk-worm eggs, yellow and white, for which please accept my most grateful thanks, those I have are dwindling to nothing, and from the little experience I have, a breed from unhealty parents will never succeed; notwithstanding all the nursing and attention I have given them, there is a dayly mortality prevails, and I fear our breed here would be extinct soon was it not for your friendly affistance.

By the bearer I return the cloth and flannel, and have the pleas

fure to be, &c.

A. BLACKADDER.

Poonamalee, April 16th, 1795.

To RICHARD MOLESWORTH, Esq. LONDON:

AVING last year transmitted you an almanac of this country, compiled by Mootiah, the translator of my publications into Malabars. I now inclose some remarks thereon, which have been made by Mr. Goldingham of the observatory here, that appear very ingenious

Doctor Berry defires me to tell you that fometime ago he fent you fome unknown feeds, which he now finds are of the Camerium

Cordefolium.—'The Boa Cre of Marsden.

JAS. ANDERSON.

Fort St. George, 23d April, 1795.

SOME REMARKS ON THE HINDOO ALMANACK, FOR THE 1716th YEAR OF THE Salivabana EPOCHA.

The places of the Planets in this Almanack, at the commencement of the year, correspond with the 10th of April, 1794, A. D.

The first column of each page contains Dênă, or the day of the months, the second Vâră, or the day of the week; the third Italia, or the moon's phase 15 in number; the fourth column, Nătchătră, or the contellation in which the Moon is found, 27 in number, a name to each; the sixth Cărănā, or half-phase of the moon, of which there are 11, each destinguished by a name; the seventh column contains Tēyājyām, or unfortunate hours; and the eighth Ahái, or the length of the day.

These

These are the principal columns; the remainder of each page is divided into portions containing the most remarkable Phenomena of the Planets, with Astrological predictions, depending on their situations; the seasts and fasts of the Hindoos, and many particulars relative to the incarnations, and transformations of their deities, &c.

The Bramins I understand, compute the astronomical part of their Calendars, to as great nicety, as their rules and tables will admit this being the case, either one or the other it would seem, is defective; as on a comparison of the Phases of the Moon, by their computation with ours, great differences, and irregularities, are generally observed—the time of their Phase, sometimes preceding, sometimes following that of ours, and sometimes, (the rarely) the difference is very small; these variations are by no means reducible to rule, which might lead us to suppose errors in the calculations, did we not know the abilities of the Hindoos in difficulties of this nature.

The following table will flew the irregularities here fpoken of, the Hindoo Time, I have converted into Solar or Apparent Time, according to our method of reckoning.

The arcs in the European column were calculated as correctly as possible. The Phenomena of the other planets in this Calendar, are not so correct, particularly of Mercury; the motions of Jupiter and Saturn (as we should imagine) appear to be the best understood; the want of the Telescope kept them unacquainted with the Satellites of Jupiter and Saturn, and the Georgian Sidus; nor could they have known much of Mercury's motion, for

the fame reason.

The Calendar ends with the 21st of March, and beginning as above; the year comprises only 346 days, being 8½ days short of the Lunar, and 10½ days short of the Solar year, this is neither proper nor agreeable to the knowledge the Bramins have had of this matter; they appear to have ascertained the year to tolerable nicety; according to them the year contained 365 days 6h. 12m. 30s. of our time, about 23½ minutes longer than the same by us now—this difference has been supposed by some to have arisen from a decrease in the length of the year, and consequently of an approach of the earth towards the sun; an air of probability is given to this supposition by comparing the length of the year, as sound by Hipparchus near 2000 years ago, with that by the Bramins, and by us.

LENGTH OF THE YEAR

A work that would be it had someth town here	D.	H.	M.	3.
By the Hindoos,	365	6	12	30
By Hipparchus, about 1940 years ago,	365	5	55"	12
By European Astronomers, at present,	365	5	48	57
To C treat mine	11 10	1	15× 81	New

Now supposing the length of the year to decrease in an arithmetic progression, we shall have the time when the length of the year was determined by the Hindoos.

Years Years Years By Hipparchus, 6' 15" 1942, 17' 18" 5375, Aftronomers at present, 6 15 1942, 23 33 7317.

Here we find a difference of near 2000 years, but the last conclusion (7317 years) where Hipparchus's data, is only once used, agrees nearest with their own account of the matter.

It is the translator I perceive, who has shortened the year in this Calendar, to prevent, (as he fays,) consustion, beginning

with one period and ending with another.

The almanack on which these remarks were made, was translated into English by a sensible and learned native, named Trevercadoo Mootiah; a man, urged on no doubt by a stronggenius, as nothing less could induce a person to bestow his time in such pursuits in this discouraging country, who has been at great trouble and expence to cultivate his mind, and who is highly deserving encouragement. With the affistance of a person of this description we might hope to bring to light, many curious, if not useful, works, now mouldering perhaps in the ancient fabricks of the Peninsula, with the seeds of many rare and valuable talents, unproductive from a want of that genial warmth, only to be bestowed by Princes and Rulers of a country.

Madras, 1795.

TO THE EDITORS OF THE COURIER AND GAZETTE.

A Sthe fruiting feafon is not entirely over, you will oblige me
by communicating to your readers, that instead of the
trouble of hair lines, which have been found neceffary to shelter
such small seeds, when evolving in a cold climate, they may
squeese the juice from what ripe fruit yet remain, spread out the
pulp in the shade to dry, winnow and preserve the seeds for sowing, after the heavy rains, when the atmosphere is temperate and
moist.

Some feeds prepared in this way last year, and fown in my garden in December, are now strong healthy plants, ten feet in beight.

JAMES ANDERSON.

TO THE RIGHT HONORABLE LORD HOBART, GOVERNOR, IN COUNCIL.

MY LORD,

BELIEVING that any proposal for improving the Country will meet with your Lordship's savorable reception, I have the honor to observe, that there is a tract of high land in the Jaghire, partly covered with hills, which is bounded on the north by the Adyar, on the fouth by the Palar, on the east by the sea, and on the west by the lands of Conjeveram.

What the collection is, from this extensive tract, of thirty miles square, or 540,000 acres, I do not know, but from inspection can fay, it is only the skirts of low land, and some small spots amongst the hills here and there, that has ever been cultivated. The rest, which is volcanic earth, and the fittest soil in India for vegetation, is rendered so steril by drought, that the jungle which it spontaneously produces is too slender to be made into billets, and the poor people can only get brush-wood, which they carry in bundles on their heads, twenty or thirty miles to market.

The grafs which it might produce for pasture, were this ground cleared of such jungle, would be a great improvement, and it would certainly be attended with public benefit, to grant freehold leases, as the occupancy of these lands would be attended with a much better supply of black cattle, sheep and sire-wood, by the industry which such tenor would excite.

In the middle of this tract, between Vandalore and Chinna Parma Coil, there is a space nearly ten miles in extent, where the land stretches out pretty level, from the foot of the hills, and it seems probable that the bed of the Palar beyond Conjeveram, may be higher than this space: at any rate, it is worthy the attention of Government to order a survey for water courses to run from the Palar, where it issues from the Arcot country towards the hills in the Jaghire, as by this means the tanks may be filled during the freshes, independant of rains in their neighbourhood, and many more tanks constructed, with certain advantage, because the water of that river is supplied from the S. W. as well as N. E. monsson, its sources reaching as far as Savandroog, in Mysore.

I am, MY LORD, &c.

JAMES ANDERSON.

Fort St. George, 3d May, 1795.

To DOCTOR ANDERSON, P. G.

A that's the pleasure to inform you, that the seeds of the bass. Tard cedar you were so good as to send me, all came up, and are thriving; I never saw any thing like them for quickness of growth: our hot winds began here in March, and since that time we have had but one shower of rain; yet notwithstanding, they have grown about four seet; the instant the rains begin, they shall be transplanted, and I have not a doubt but that they will be forty seet high, before next March: if you could oblige me with more seeds, I should take it kind.

Enclosed I do myself the pleasure of sending some seeds of the Arnotta tree, with the color adhering, lest you should have none of the trees; also a little of the color, which is much admired at home, if you wish for more of the seeds, I can send you a

quantity.

I hope your filk manufacture is going on to your wish,, you have met with many crosses where it was not to have been expected. I have been obliged to reduce my schemes: I was led into expence from the promise of Lord Cornwallis to assist me, in which I have only myself to blame—I ought from the length of time I have lived in the world, to have known better.

JOHN GLASS.

Bhaugulpoor, 19th May, 1795.

N. B. The color fent was washed from the seeds.

To DOCTOR ANDERSON, P. G.

By defire of Captain Wilks, I enclose you some of the seed of the Ankree, a species of grass apparently similar to the Spanish chichling-vetch, found also in America. It is indiginous to, and grows spontaneously, in the province of Bahar, and the Zemindary of Benares: it appears in the month of October in great luxuriance, upon those low grounds that have been inundated by the waters of the Ganges, admits of three or four cuttings, runs to seed, and sades in April.

A bag shall be forwarded to your address by sea, and I shall be happy to procure you a supply of any quantity, should you find it useful: one biggah supports three or four horses during the

feafon, in rude health and good condition.

H. FRASER.

Calcutta, May 4th, 1795.

To JAMES ANDERSON, Esquire.

AM forry to acquaint you with the bad success of the worms under my care, which is such I hardly know what to do.

Though I kept more cacoons produced from the eggs you were fo good to fend here, than by a register from the commencement of the business should have filled the business was Vellout and Trivallore with worms, yet I sound myself fadly disappointed, but determined not to be so again, I preserved an immense quantity of cacoons for eggs, still the failure is so great I have not the number of worms I wanted.

The defect I mention is not in the cacoons, moths or eggs; but only in the young worms, which disappear after they come out of the eggs, and the people begin to feed them, though there is nothing wrong in the leaves, which are brought into the bun-

galow fresh and good.

I have also been careful to have the west side of it well shut, and now keep the sloor wet by throwing water over it, and have the small worms fed 12 times in the 24 hours, but cannot yet say what effect watering the sloor, and the additional feeding will have.

As I prefer loss of rest to seeing the business go on the way it does, I have begun to stay in the bungalow all night myself, and now give so very small a part of my attention to any thing else, I can see minutely carried into execution any instructions you may think proper to give me, for which I shall be exceedingly obliged, and for your opinion respecting what has happened.

BOSWALL PARKISON.

Vellout, June 24th, 1795.

To Mr. BOSWALL PARKISON.

It never was my intention to make filk in quantity at Vellout, if you will take the trouble to read my Publications, you will fee that the establishment under you, is folely recommended for the distribution of the plant, in and over all the Jaghire, as however, you feen folicitous to keep worms, you may easily fatisfy yourself at any time, by looking into the Bungalow in my garden, where there is no particular care, and yet the worms are perfectly healthy, and can be multiplied at pleasure.

JAMES ANDERSON.

Fort St. George, June 25th, 1795.

To DOCTOR JAMES ANDERSON,

AM directed by the Right Honorable the President in Council, to send you the enclosed Extract of a Letter from Canton, in answer to an application which was made to the Supercargoes at that place, at your instance, for procuring a supply of Silk Worms and Mulberry Trees.

J. WEBBE, SECRETARY.

R. SHERSON, Examined. Fort St. George, 28th June, 1795.

Extract of a Letter from Canton, dated 25th March. 1795.

WE are forry it has not been in our power to fend you the Nankeen Silk Worms and Mulberry Trees described in your letter of the 28th June, 1793, every attempt made by the Residents here to procure the genuine fort discribed by Mr. Fru-

shard, having proved unsuccessful.

His Excellency Lord Macartney, in his journey from Pekin, was fo fortunate as to obtain fome worms and Plants of the right fort, but as his Excellency's inftructions, on the subject were confined to Bengal, and the quantity he had was not very great, he did not think himself authorized to part with any of them to us, for the purpose of sending to Madras, where the probability of their succeeding would not be so great.

Should these worms reach in safety, we hope your settlement may in a short time be supplied from thence with less difficulty than can be done from this country, however if a favorable opportunity should offer for procuring any which we can be affured are of a proper kind, your Lordship may rely on our forwarding them

to Madras, by the earliest conveyance.

A. FALCONAR, DEP. SEC.

A true Extract, A. SLINGSBY, Ex.

To DOCTOR ANDERSON.

THE bearer, Mr. Lyte, who has for some time past been employed here, is going to your side of India in hopes of bettering his situation, he is a native of the West Indies, and is acquainted with some of the branches of their cultivation, he never

was in my service, but I have had some acquaintance with him, and have sufficient reason to believe, that he is a sober, quiet, honest and intelligent man, should any person who is concerned in your new speculations of cotton or indigo, have occasion to employ him, I am consident they will find him deserving of their considence.

H. SCOTT,

Bombay, 14th June, 1795.

To DOCTOR ANDERSON, MADRAS,

AM favored by the last despatches with your printed correfpondence of 1793, relative to filk and to bastard cedar trees, together with some of the seeds, for which I am obliged to you,

though without any accompanying letter.

I have to observe that you still continue to let the mulberry trees grow to 30 or 40 feet high, though I presume that is for the purpose of fruit, and seeds for propagation, because the leaves of trees of that height are not near so fit for food for the worm being hard and coarse, which must affect the worm and the filk, for which reason the soft and tender leaves of the young plants are best, giving the worm a good color, and rendering the silk almost

transparent.

I have now only to add that as there seems a spirit of improvement in India, and an attention to useful productions of nature, I take forgranted that the bread fruit tree, has not escaped attention, and I have the pleasure to tell you that a very considerable number of them having been successfully brought in the Botanical ship Captain Bligh to the West Indies, His Majesty has ordered one half to be left at St. Vincents and the rest carried to Jamaica; they arrived safe and thrive exceedingly at both places, I should imagine they would equally flourish in India and if produced in great abundance might yield a valuable supply of food—The spices of India are also now cultivated with success throughout the West Indies.

That your useful endeavours may be crowned with success, is

the fincere wish of, your, &c.

GEORGE YOUNGE.

To JAMES ANDERSON, Esq.

AM favored with your letter of the 25th Inftant, as I am certain the failures of the worms here have not proceeded from

any want of care on my part, I am the more anxious on this head, because should reports go abroad amongst the people, that the worms at the Company's and Mr. Woolf's silatures are subject to such accidents and so frequently, it may in addition to their natural prejudice to every new speculation, operate as an insuperable bar to the introduction of the culture of silk amongst them, and as my only object is to surmount every difficulty, I shall be obliged to you for any farther information on the subject, and will be thankful for one of your people who superintends the seeding of your worms, or who feeds them, that I may be certain every thing is done here as it ought to be; in making this request I am influenced by a double motive, the desire of doing what I can towards the success of the undertaking, and credit to your recommendation of me.

That I may have your instructions about what is now doing, it is proper to acquaint you with the way the worms here are reared. When they first come out of the Eggs, leaves cut very small are strewed over them, with which they are removed to a mat, and fed with the same kind of cut leaves, cleaning them is performed by separating the upper layer of the leaves on which the worms are removed to another Mat. The only difference in the farther care of them is, that the leaves are cut proportionally larger, as the worms grow, till at last they get them whole; as mentioned in my last, I continue to feed them 12 times in 24 hours, but have left off watering the shoor of the Bungalow, for sear of hurting the worms by the damp.

Though it has not been your intention to make filk at Vellout, yet as it feems to me necessary to convince the natives by example, that the worms can be reared, I am the more folicitous to obtain duch information, as to the cause of the failures of the worms with me, first by fickness and now dying shortly after they come out of the Eggs; as may prevent the like happening again, I shall therefore be particularly glad of your opinion about it, and if you think keeping different successions at once, hurtful to the worms.

The worm house at Trivallore is now perfectly established for instructing the people there in the care of the worms, and supplying them with every requisite for the undertaking.

BOSWALL PARKISON.

TO MR. BOSWALL PARKISON.

AM favored with your letter of the 1st instant, and am pleased to fee that your anxiety and zeal for the success of the silk Manufacture is no ways impaired, as it will be very agreeable to me to promote your wish of preserving the worms in health

at Vellout and Trivallore.

Not however having encreased my own establishment, I have no spare hands, or would readily send you one, but from the account you have transmitted, am enabled to say that too much care, has been the cause of sickness amongst your worms; for the leaves bleed and lose their say, if cut in the way that you describe, and the worms are too much disturbed by feeding them so stee the say of the say o

In the mornings therefore, when you fee the eggs hatching, lay fome young tender leaves over them, and when these leaves are covered with young fry, let them be taken up by the falks and laid on a clean basket or mat, that has been well rabbed over with cow-dung, setting it in the fun shine to dry before it is used, continuing to feed them four times in the day and three times in the night, which will be sufficient, and to obtain leaves of this fort, cut down a part of your Plantation in succession, within it inches of the ground.

As the accumulation of litter and dung is liable to ferment and generate fowl air, every fecond day, the worms should be shifted to a chan basket, which is best effected with nets on which they are removed with nothing attached to them, besides the leaves of the last feeding; the succession of different batchings at once is a great relief to the labour, and a means of preventing

fickness.

You have a great deal too much feaffolding at Vellout, the stages of which are so high that the feeders must do their work aukwardly, as well as that a circulation of air is prevented by so

great a number of mats.

What I have found answer best is to have finall portable frames two feet and a half high with only three stages, on which baskets five feet in length and three and a half in breadth are placed, so that a boy of 10 years of age can reach a handful of leaves over the highest basket, as well as that it is of consequence that the worms should be under your eye, and that you readily see how every thing about them is situated, as you walk through the Bungalow.

The worms at Poonamallee are in perfect health, and Mr. Blackadder affures me yield the most beautiful filk; nor is there

н

any apparent reason besides what I have mentioned, why you should not have equal success.

JAS. ANDERSON.

Fort St. George, July 4th, 1795.

To JAMES ANDERSON, ESQUIRE,

AM favoured with your letter of the 4th instant, and hope you will excuse my again requesting one of your worm feeders, if but for a day, to put the people here in the way of feeding with whole leaves.

I have now put the mats to double the diffance from each other they were before, and the number of feedings are reduced.

I am happy to acquaint you the worms have for feveral days past been coming on very well, fince the heat of the weather has abated.

I cannot allow that Mr. Blackadder's fucces has been more than mine, for he also has lost numbers of young worms, and that you may tee my filk wound, I fend two skains of it.

BOSWALL PARKISON.

Vellout, 7th July, 1795

To Mr. BOSWALL PARKISON.

A S no filk can be more beautiful than the two skains you have fent, it is with pleasure I fend the bearer Sattavagi, who will shew your people how to feed with whole leaves, and have told him that in a few days he will return, as soon as that purpose is effected,

JAS. ANDERSON.

Fort St. George, July 8th, 1795.

To DOCTOR ANDERSON, P. G.

AM much obliged by your letter of the ift instant, and feel heartily inclined to meet the views of Mr. Lyte by employing him in the cultivation of coffee, cotton and sugar, as it appears he is somewhat acquainted with it.

From having failed in all my endeavours to perfuade people to enter into such a speculation in these districts, I have not made it my business to enquire if it would answer or not, and I fancy the doubts they have entertained on this subject have deterred them.

The information wanted to confirm or remove these doubts can I imagine be soon procured, and if Mr. Lyte will come

to the Barramahl, we can then see what steps should be taken in

The expence of labour here, the distance of land carriage, the uncertainty of a market, the getting a price that would defray all charges, and bring a profit that would answer Mr. Lyte's expectations, are all I conceive, the principal hears of enquiry.

If he chuses to conduct the business on his own bottom, I'll-give him land enough, and though I would not, under the very doubtfulprospect I have of such health as will enable me to remain long in the country, like to risk the injuring my own circumstances, I would very gladly contribute to the setting him fairly a going, did I see a tolerable chance of his succeeding.

If again he should find upon enquiry, that the entering into such a speculation probably would not answer, and he would chuse to engage in the cultivation of the ordinary productions of the country, I should be happy to employ him, by putting a village

or two under his management.

My motives in this would be the acquiring information on Indian hufbandry and the introducing improvements in it among the natives of this country, a business I have long had in my mind, and which the multiplicity of other business has hitherto, and I see always will, prevent my making a trial in.

Should he like this, I would likewife give him charge of z village or two in junction with an intelligent native, who would and his endeavours, and would infruct him in the country lan-

guages.

From this you may rather form an idea of the business in which a person like Mr. Lyte could be employed in these districts, than one of my expectations from his experience, for I guess that he would have more to learn on coming here than he would have to teach others.

However this may be, I think he cannot lofe by coming hither, for if the trade of farming and manufacturing should not answer, I imagine he would do very well in the capacity of writer, accountant, or surveyor, and thus if deficient in either, he would sooner qualify himself to be useful in one of them, than in the other lines.

Moderate as my expectations may be, I would give any man of the character you give him, twenty pagodas per month, and you may offer him that for the prefent: if he agree please to advance him two or three months pay, if he requires so much, and send him off loaded with seeds and with information of all kinds.

H 2 This

This is written in the greatest haste, the tappal hour being at hand; I shall probably write you again in a day or two.

A READ.

5th July, 1795.

To JAMES ANDERSON, ESQUIRE, P. G.

AM this moment returned from an expedition to a place called Talamalee, 15 miles from hence, to endeavour to find out a gun road, the whole road is a beautiful jungle, or rather a forest, with noble timber trees of every fort, great varieties of them I never saw before, and no want of teak-wood here.

I have fent you two parcels, one containing ten of the wild nutmegs, the other, the flower and leaf of the nutmeg, with three varieties of the fern, you will be fo obliging as to give these

parcels to Doctor Berry, with my best falam.

The nutmeg trees I have feen are as flraight as an arrow, and about 150 feet high, and very thick, I should imagine they would be fine wood for cabinet work. This jungle contains the pepper plant, the cardamom, ginger, turmerick, saffron, and a variety of things that I had not time to examine, there are about 20 or 30 inhabitants at Talamalee, who live upon what they beg from the passengers, and the product of the jungle, that is to say the felling of the cardamoms, &c. to passengers, this life they prefer to cultivating the lands, I wished much to get them under me here, but used to the roving life they lead, they will not forsake it.

I am afraid you think I have forgot my promise of sending you the pepper plants, they were sent to Dindigul about a month ago, but not in that order that it was possible to forward them on; I hope to send them, and some others from Cumbie, in a few days. Berry ought to come and examine these woods, he would find a thousand things he never saw before; elephants are innumerable here, and the great terror to man, as they are very

vicious.

GEORGE WYNCH.

Goodeloore, 16th July, 1795,

To DOCTOR ANDERSON P. G.

I RETURN you many thanks for your interesting communication, which I received yesterday, and have read with much pleafure.—The benevolent aim of all your labours must excite a lively lively wish in every person for their ultimate success and prospesity—I am extremely happy to learn that you have at last been able to obtain the cochineal infect from America, and besides the interest which every one must feel in an event which tends to enlarge our knowledge, and improve our commerce, I cannot but sincerely rejoice personally on your account; knowing how satisfactory it must be to you, and that it will in some measure competisate the many difficulties and discouragements, which have been thrown in your way—Those it is to be hoped, you will be able to surmount, and finally to accomplish the useful work

which you have begun.

In the midst of the difficulties and obstructions which necessatily attend the progress of a new undertaking like this, every liberal mind will find a pleasure in reflecting, that an art once established perpetuates itself, that the most beneficial improvements are also the most lasting, and though their first beginnings are slow and difficult, their after duration is but little affected by the revolutions of power. Even the introduction of an useful vegetable is an acquifition of which conquest has never deprived the world. The cherry tree, which was first transplanted into Europe by a Roman Conful, has long outlived the downfall of the Roman power; tho' Lucullus when he adorned his villa with this useful tree, little thought that he was doing what would furvive the effect of all his victories, and even the greatness of his country. Instances conformable to history and experience, will seldom belie our expectation, and it is reasonable to hope that the growth of the mulberry and opuntia, with the valuable infects which feed upon them, will probably continue to awaken industry and multiply the means of subfiftence on this coast, after the memory of more splendid events, which often only operate to waste and de-stroy, has been long lost and forgotten, but whatever be the final refult, this at least must be the earnest wish of every person who is a friend to mankind.

FRA. DUNCAN.

Warriore, August 8th, 1795.

To DOCTOR ANDERSON, P. G.

REQUEST you will accept of my best thanks, for having by a late tappal savored me with a copy of your late publication, in which you announce to the world your having succeeded in having imported into this country the true cochineal infect from America,

The farisfaction you, Sir, no doubt feel in having conduct ed to fo fortunate a termination a scheme originally dictated wholly by philanthrophy, purfued through many discouraging circumstances with unremitted diligence and zeal, and eventually pregnant with benefit as well to the state, as to thoufands of our fellow creatures, must be your best reward, and renders the congratulations of those who have the pleasure of knowing you, but little necessary-I have therefore only to express my hopes, that our rulers, encouraged by this second in. stance of your success, and convinced of the great benefit of at all times diffeminating uleful knowledge, may in future readily afford you all that support and countenance, which purfuits of fuch extensive utility are entitled to claim, and also for the good of mankind, to wish that you may long be bleffed with health, to enable you to point out and fuperintend fimilar enquiries, and that you may frequently en. joy the pleasure of bringing them to equally fortunate terminations.

ALEX. KENNEDY.

Tanjore, August 10th, 1995.

To JAMES ANDERSON, Esq.

I SEND back the man you was fo good to let me have, in confequence of being obliged to make accounts with reports of the flate of the plantation, to be laid before the Board of Revenue, I have not been able to pay the attention I wished to feeding the worms with whole leaves, but the head man of the Bungalow has declared himfelf perfectly capable of it.

I have made a large window in the roof of the Bungalow, and am going to make more, which will be a great improvement, as it must keep up a circulation of air, without the wind blowing

on the worms, and at the fame time let any foul air off. I have been this morning at Mr. Blackadder's, and perhaps

never was finer worms or cacoons feen than we both have.

BOSWALL PARKISON.

Vellout, 11th July, 1795.

To DOCTOR ANDERSON, P. G.

FEAR I have yet to acknowledge the receipt of a short let-FEAR I have yet to acknowledge the ter I received from you either immediately previous, or just ter I received from you either immediately previous, or just fubfequent to the Nizam's retreat from the Maratta army-for sometime past I have been prevented by indisposition, from ta. king king up the pen, which I now refume with the greater fatisfaction, as I think I may venture to hazard an opinion, that the return of peace, and the disposition of some of the new leading men at this court, are likely to prove favorable to the effectual

profecution of our filk worm fcheme.

In the course of our progress towards the Maratta Frontier, I amused myself in picking up some of the mineral productions that I sound scattered over the surface of the soil, being however quite unskilled even in the first elements of mineralogy, I could only select such pebbles, chrystals, &c. as caught my eye, either by their novelty, the splendour of their colour, or the apparent oddity of their forms—such as they are, however, I propose submitting them to your inspection on my arrival at Madras, when if you should be able to select a sew pieces from them worthy of a place in your cabinet, I shall esteem myself sufficiently rewarded for my trouble.

I propose likewise bringing you a small quantity of ghya, a species of dry rice, which is it should succeed as well in the dry unflooded grounds of the Carnatic as it does in similar situations in the country of Nepaul, from whence my Brother brought the original seed, you will unquestionably consider as an invaluable

acquisition to the country,

The feed I propose offering you is partly the produce of a crop raised near Calcutta, on a spot not liable to be stooded, and partly that of a small crop we had last year at Beder, on a similiar spot of ground, from Nepaul seed.

JAMES ACHILLES KIRKPATRICK.

Mr.

Hydrabad, April 6th, 1795.

To JAMES ANDERSON, Esq.

A GREEABLE to your defire, I shall endeavour to give you what information I can respecting the practicability of ob-

taining the Carmenian goats from Perlia,

Being at Bussora in the year 1792. I there saw a male and semale, which Mr. Small, Surgeon to the Factory, had brought with him from Bunderick, where he had purchased them at an inconsiderable price—he then informed me that the person he had them of, offered to procure a sew more if adequately rewarded for his risque and trouble, as the government of that part of the country of which they are natives, has strictly prohibited their exportation, and the distance they were to be brought, is very considerable. Mr. Small, did not at that time think proper to be at fo great an expense on his own account, but having afterwards learned that the Court of Directors were defirous of procuring a breed to be fent to Europe, and Mr. Manefty the Refident at Buffora, having applied to Mr. Small for those I have mentioned for that purpole, he the year following while at Buffire, actually made an agreement with one or more persons, who undertook to bring a considerable number of the Carmenian goats, to be delivered there, Mr. Small soon after proceeded to the sactory at Grain, where he unfortunately sell into a bad state of health in which he continued till his decease, in the end of 1794, possibly within the time specified for the delivery of the goats.

Whether the failure is to be attributed to this circumftance, or the want of faith on the part of the people he employed I am igmorant, but it is not improbable that the laft may have been the true cause, as they are noted for imposition, and it appears to me that the success of any future attempt to procure these goats by this rout, will greatly depend on the person so employed, having been resident for some time among these people and having some

knowledge of them.

The above is the whole of what I could collect on this subject, during two voyages to Bussora, and a short stay there; I shall feel myself singularly happy if you can derive any advantage from it.

A. H. BOGLE.

Ship Swift, Madras Roads, July 18th, 1795.

To JAMES ANDERSON, Esq.

THE pleasure I feel in giving any information that may give you satisfaction with regard to the business I am engaged in makes me lose no time in transmitting the inclosed, which is a copy of an advertisement to be immediately circulated by med in Malabars, amongst the inhabitants.

BOSWALL PARKISON.

Vellout, July 10th, 1795.

TO THE AUMILDARS, RENTERS, NATAWARS AND VILLAGE PEOPLE, OF THE SAUTMAGANS POONOGMALDEE, AND TRIPASSORE DISTRICTS.

A T the Honorable Company's plantations at Vellour and Trivalore, the filk worms with leaves, and every other requisite is now ready to commence the filk business, therefore Mr. Parkison, superintendant of the Honorable Company's plantations

informs

informs the Aumildars, Renters, Natawars, and Inhabitants, that he will let them have filk worm eggs with every thing necessary for rearing worms as in the Honorable Company's filk-worm house (viz.) matts, bamboes, and knives, with leaves &c. from the plantation at Vellout and Trivalore, without charging one cash, and any inhabitants who will employ eight hands on this business shall have a clever man to teach them, who will be paid without their being at any charge on his account, but the rearing the worms is very easy and may soon be learned, for it is done in Bengal by women and children.

When the worms come out of the eggs they require to be fed four times in the day, and three times in the aight for 24 days, after which they begin to make cacoons, when there is no more trouble with them; in a few days more the cacoons will be ready for fale, and immediately upon their being brought to the company's filature at Trivalore or Vellout, ready money will be paid

for them.

Two moths from the two cacoons, should give 350 eggs, and each egg a worm, so that only 600 cacoons need be kept for breeding, by whoever wishes to rear 100,000 worms, that will bring them 200 sanams, if they take leaves from the Company's plantations, or 333 sanams, if by cultivating the mulberry, on their own account, they provide leaves for their worms.

When the cacoons are brought for fale, one fanam will be paid for every 500, at the fame time that leaves and every requilite is given, without making any charge, and those who produce the first cacoons, will be entitled to a present from the Honourable Company, and their names shall be reported to the Collector,

and the Board of Revenue for their favor.

Whoever will plant the mulberry for leaves, and feed their own worms, shall have for only 300 cacoons one fanam, and to put it in the power of those who may wish to avail themselves of so great an advantage, they shall on giving proper security have a sum of money advanced them to make plantations, that they may be enabled to provide their own leaves.

To DOCTOR ANDERSON, P. G.

A S Mr. Lyte prefers the trying his fortune in the Barramahl I shall entertain hopes, that something will be done at last towards the introducing in it the more valuable productions and manufactures, by which we may expect with more certainty than by any other means, it will become a richer country.

I have the pleasure to inform you, that my affistants, Messis, Macleod and Monro, propose likewise to embark in the same laudable scheme, if our superiors approve. They have applied for a farm to the Southward, about fixty miles W. by N. of Trichinopoly, and if granted, I shall ask for one, if it only appears eligible on consideration, in one of the eastern districts of the Barramahl, probably within one hundred and fifty W. of Madras.

I reckon, that should our speculation turn out half so well as may be expected, there will always be people ready to take it off our hands when we quit our situation, for the difficulty of a work

of this kind is only at the beginning.

Indeed I shall not be disappointed if I save myself, and shall only care on account of the failure of it, if I should be some pounds out of pocket, for though I have not yet shown any public spirit to boast of, my main object in this business, is the good of my country.

As portending fomething very favorable to our views, I must inform you, that I have this morning received officially from the Board of Trade, through the Commercial Resident at Salim, two packages, containing two samples of Ganjam sugar and several of Indigo, from different places on the Coast, with labels on each informing the price, but what is extraordinary, no intimation of the purpose for which they are sent, possibly it has been resolved to try the experiment I recommended, of holding out a certain market for those commodities.

That would affuredly answer; and if it be the case, you may expect to (ee, and that in a short period, plantations rising in every district.—The Company would then get as much as they want of them without risk, and the culture of them would be the care and the advantage of the individual.

The drudgery of my employ preventing my refearches into the nature of the foil, I must be contented with ascertaining the properties of the weather, which may be of some use in husbandry, and to this end have begun a diary lately.

By the help of our rude artificers here, I have made shift to construct an Hygrometer with thin paper, which proves sufficiently susceptible of change in the air, and an Ærometer which shews the velocity and direction of the wind with great exactness.

Having bought a Thermometer and water-gage, all I want to complete my apparatus is a Earmometer, which I have long been in queft of, this account tierefore is from the hope that you will try what you can in procuring one for me,

Possibly

Possibly I may hereaster have matters to communicate more interesting to you, but the constant rotine of Revenue Business, is a bar to much being done in the way of improvement in my time, you may however, if Mr. Lyte be diligent, receive gratification from his endeavours, should be try the line you propose.

A. READ.

July 16th, 1795.

To MR. BOSWALL PARKISON.

I AM favored with your letter of the 10th, enclosing copy of your Malabar advertisement, which, although a proof of your attention that will always do you credit, yet until administration adopt measures very different from a continued pressure for encrease of revenue; neither this nor any other new manusacture can possibly slourish as they ought; and the old will go to decay.

IAMES ANDERSON.

Fort St. George, July 28th, 1795.

TO SIR GEORGE YOUNG, BART. LONDON.

AM favored with your letter of January 14th, reccommending the pruning of the Mulberry, and an attention to the culture of Spices, which I have perufed with much fatisfaction; having found by experience, that the best leaves are obtained from the Mulberry, by cutting it off at the height of fix inches from the ground every fix months.

This part of the country, however, appears to me to be under the influence of too dry an atmosphere the greatest part of the year, for plants which are natives of the islands like the Spices—the Cinnamon indeed, continues to flourish attonishingly at Palamcotta, and will no doubt succeed in the interior of the country amongst the Hills, but the level country near the Coast, is too dry

and too hot.

The improvements I introduced have been nearly at a stand, ever since it appeared, that four shillings an acre would be expect-

ed for waste land, when brought under cultivation.

I am still however much gratified, and slattered by the attention of persons like yourself, possessed of adequate knowledge on such subjects,

JAMES ANDERSON.

Fort St. George, August 3d, 1795.

To JAMES ANDERSON, Esq.

E NCLOSED is copy of my last letter to Mr. Place, on the subject of rearing filk worms, in which I have given him

I 2 my

my sentiments on the business, and what I say to him about its being very capable of being carried on with advantage to the Company and individuals, is the result of a series of remarks and

calculations made to the hest of my judgment.

By a man whom I fent about with the advertisements, to whom I gave private directions to take notice of what remarks the people he gave them to might make, I am informed the grand objection is made to the care of the worms in the night, and if I may judge from experience it will be a great obstacle, for sleep is too great an indulgence to them to be broken in upon, by any thing less than absolute necessity, and it strikes me that so long as they think it is requisite it will be a great hinderance, I therefore intend to make trial of seeding the worms at to P. M. and 5 A. M. but in the day time as usual, and if I find the worms can be brought to perfection in that way to give general notice of it.

I have to apologize for not before this acknowledging the great apparent improvement in your mode of feeding the worms

now adopted.

BOSWALL PARKISON.

Vellout, August 6th, 1795.

To LIONEL PLACE, ESQUIRE,

COLLECTOR OF THE HONORABLE COMPANY'S JACHIRE,

THE 25th instant, I forwarded to you a copy of an advertisement for the purpose of introducing the culture of the
mulberry and silk worms amongst the natives, also some Malabar
translations, but have not yet circulated any, as it does not appear
to me proper to require the hamildars, to do so without your particular directions, and with regard to the inhabitants, I wish to
know if I may without any reference to the hamildars, &c. acquaint the village people with the contents of the advertisement,
as from circumstances it may appear to me most likely to attain
the end proposed.

I have this day received a letter from the Board of Revenue defiring me to apply to you, for your aid in promulgating, and rendering the advertisement fully understood by the natives, in all

parts of the country, as I mentioned in my last.

I not only look to you for this, but in short for the entire success of the business; the utmost of my exertions, must necessarily be so confined, even for the efficiency of them I must depend upon you,

I have reason to apprehend the existence of the undertaking, on this part of the Coast depends on the introducing of it amongst the natives, and I dare say it may not surprise you, who must be so well acquainted with them to find a business at least so far as I can judge, very capable of being carried on with advantage to the Company and individuals fail, from the worms being reared by people in monthly pay, if you consider, how differently they act, when their own immediate interest is at stake, and when working for another; this I have hously experience of, and from remarks made by Mr. Corbet, on the silk business that has been so long carried on in Bengal, it appears that rearing worms in the present plan is attended with certain loss, from no other cause I can see, but what I have mentioned.

These reasons are to me, Sir, evidently the source of the want of success; and they make me anxious to get the natives to take

it up.

BOSWALL PARKISON.

Vellout, July 28th, 1795.

To Mr. BOSWALL PARKISON,

AM favored with your letter, inclosing a copy of that to Mr. Place, to whom the Revenue Board have referred you, and am fatisfied that your letter contains the most adequate idea as the people will be more readily influenced by an immediate reward, than by any kind of authority, and therefore a little trouble and expence by you to get some housekeepers in every village in your neighbourhood, to undertake the keeping of a sew worms will effect more than the interference of renters or aumildars, whom they will suffect of loading them with new labours.

You might encourage them to begin by defraying the expence of erecting huts, for sheltering the worms in all the neighbouring villages, where any of the people will come into your plan, and the Revenue Board must be fensible, that so grand, and so new an undertaking will be attended with unforeseen expenses,

to render it of that utility of which it is susceptible.

If the worms are sed four times in the day regularly they will thrive very well by feeding them at 10 at night and 5 in the morning, as you mention; which removes the objection about

fleeping in the night.

As the practice of rearing worms at their own houses by the villagers, and distributing plants, is all that is wanted to compleat the intention of your establishment, I am of opinion it would be worth your while to supply any of the village people you can persuade

persuade to begin the undertaking with leaves, &c. &c. by sending them to them, without putting them to the trouble of coming for them, and when once they are fairly begun you will find they necessarily go on, as the advantages resulting will defray the expence of new wants, which all mortals have when the means are in their power, and the thing as necessarily becomes a habit as their present habits.

JAS. ANDERSON.

Fort St. George, August 7th, 1795.

To JAMES ANDERSON, Esq. P. G.

I WAS favored with your publication respecting the culture, of the native nopal for rearing the American Cochineal, and have the pleasure to acquaint you, that I some days ago commenced planting it all round this plantation; a line of about two miles, which will answer two essential purposes, a fence and a

nursery for the cochineal insect.

I am happy to tell you that the filk worms here are much improved, after a temporary fickness, owing as I suppose to feeding them on leaves that were too old, which I was under the necessary of pulling to bring on a new crop, and I have now brought the worms to a daily succession, otherwise I could not manage them here as in Bengal in periodical bunds, for reasons you must be well acquainted with.

A BLACKADDER.

Mulberry Plantation, near Poonamallee, August 13th, 1795.

To DOCTOR ANDERSON, &c. &c.

BY the general orders which I have this 'day received from Sir Robert Abercrombie I have the pleasure to inform you, that your friend Captain Neilson is appointed to the 74th Regiment, vice Aubrey.

JAMES ROBERTSON.

8th August, 1795.

TO DOCTOR ANDERSON, P. G.

AM this day favored with a fmall publication on the Cochineal infect, and feel much pleasure at the prospect of your endeavours to introduce it in the country being at last crowned with success; your letter in the Courier two months ago, intimating the arrival of the insect in Bengal, attracted my notice, and I would at that time have wrote you a few lines to offer my services, in the cultivation of the nopal here, but a fevere indisposition which seized me soon after my arrival prevented me doing my-felt that pleasure.

As far as I can judge of the climate of Dindigul it is more temperate than many parts of the coaft, the land winds which prevail at this feafon of the year although at times boifterous, are never hot, and being fituated nearly midway between the two Coafts, it feems to partake of both monfoons, the weather has been sool and pleafant for these two months past, with frequent rains.

If you fee that I can be useful I beg, that you will command my services.

GEORGE WILSON.

Dindigul, August, 8th, 1795.

To JAMES ANDERSON, Esq. P. G.

HAVE the honor to acknowledge the receipt of your last publication about the importation of the American Cochineal, and must be gleave to offer you my best congratulations on the subject of so much importance.

If I mistake not, in the year 1787 you sent to Doctor Turing, some prickley Nopals which have since thriven so immensely that this Fort and Petra are full of them.

I have also planted a good quantity in my garden, besides three kinds of opuntia, that the late Doctor Binny was so obliging to give me.

My plantation of mulberries fince have fallen away on account of the hedge not being sufficient to protect them from cattle, however I have many mulberry plants remaining as many as to enable me to keep the breed of white filk worms which I still preferve.

Some time in last month Captain Robert Mackay, honored me with a call, when I shewed him my worms, and he wished that I should keep the breed till such time as he would return to Hydrabad, he enquired also for the yellow sik worms, but having had the misfortune in June was a twelvementh to lose that breed, if it would not be taking up too much of your time, and you have it in your power to spare a sew eggs of that kind, I should be very thankful for the savor of them.

CHARLES FREEMAN.

Masulipatam, August 7th, 1795.

To DOCTOR ANDERSON, P. G.

WITH pleasure acknowledge the receipt of your publication upon the subject of the introduction of Cochineal infects from America, a circumstance which I am extremely happy to hear of, knowing that you have long wished to accomplish that end.

The culture of Cocnineal in the Honorable Company's teritories, must certainly become in the course of a very short time, a lucrative article in their trade, and also give employment to many

of the needy natives.

I planted the different kinds of nopals which Doctor Berry was fo good as to fend me fome time ago, and they feem to grow very

well.

I am glad to hear that the infects adhere to the nopal which gives the yellow flowers, as there is plenty of it in every part of this neighbourhood, it has not near fo many prickles as fone of the other species of opuntia have, which will be a great advantage incollecting the infects, I therefore mean to make a plantation of it immediately,

SAMUEL MAC MORRICE,

Salem, 9th August, 1795.

To Mr. MAC MORRICE, Assistant Surgeon at Salim,

I AM favored with your letter acknowledging the receipt of any publication of the importation of American Cochineal, and as you feem defirous of extending its cultivation I would advife you to get a fmall fpot of ground, 100 feet fquare, will be enough to begin with, that is well sheltered from winds, and plant it with the yellow flowered naga calli at an interval of five feet distance between the plants, and as soon as you acquaint me that they have taken to the ground I will defire Doctor Berry to forward you a breed of the infects,

JAMES ANDERSON.

Fort St. George, August 17th, 1795.

TO CAPTAIN ALEXANDER READ,

MR. LYTE'S illness having been of such a nature as to require a regimen and course of medicine for its removal, has
prevented my being able to forward him to you as I promised,
but this will prove no disadvantage to your landable views of
differ inating a knowledge of valuable improvements in the coun-

try, as he is by his stay here acquiring the management of Cochineal, which of all things is the most worthy your attention.

In the Botanical Garden at Calcutta they have a thousand Plants covered with the insect, enough to stock all India immediately: many gentleman there are laying out plantations, and Doctor Roxburgh issuing a breed to every part of the country.

Doctor Berry is likewise already able to do the same here, having several plants covered with them, as well at Marmalon as in my garden, both in a sheltered and exposed situation, in a thriving way, as it appears, by experience, both here and in

Bengal, that even heavy rains do them little injury.

The best way to begin the management of them I should imagine, would be to plant sinall spots that are sheltered from winds, in the village gardens, with the common opputia called by the Tamuls Naga Calli which is the only plant they are found to live on, and that which I first cultivated and distributed over the Country for this purpose in 1787, and to avoid any impediment of expence; I could wish that the spots of ground, do not exceed 50 or 60 feet square, which will contain 100 plants, at 5 feet distance one plant from another; and after a knowledge of the management is acquired, may be extended at pleasure.

JAMES ANDERSON.

Fort St. George, August 20th, 1795.

To DOCTOR ANDERSON, P. G.

H AVING distributed all the bastard cedar seeds you were so good to let me have, among the jaghire villages, and found the quantity insufficient, I take the liberty of sending a messenger who will take charge of as many more as you can spare.

LIONEL PLACE.

Trimashee, August 10th, 1795.

To DOCTOR JAMES ANDERSON.

WITH the utmost pleasure I received your note of this day, with the waistcoats and musters, which delighted me much, seeing that by the happy industry of men, the progress of the woollen manusacture, through the laudable attention and patriotic zeal of Sir John Sinclair is gaining ground to the honor of its kingdom, and the convenience of the inhabitants thereof.

One

One of the waiftcoats with gratitude I receive, and return the other herewith, and permit me to add, that with pleasure I re-

turn both you and Sir John Sinclair, my fincere thanks.

If it is not inconvenient to you, write for two pieces of the muster that is not numbered, and has green slowers. The value thereof I will chearfully pay, and by doing so you will much oblige

SHAMIR SULTAUN.

Madras, 20th August, 1795.

To the Hon. EDWARD SAUNDERS, Esq. acting covernor, and council.

HAVE the pleasure to send you herewith, two parcels of filk, amounting to nine pounds nearly, which I have received from Abdul Wahab Cawn Bahader, to be transmitted to the Honorable Court of Directors, and which I trust you will readily transmit, in testimony of the folicitude some of the Princeshere, have shewn to the success of this laudable undertaking; efpecially Abdul Wahab Cawn, as this filk is the produce of his laghire of Chittore.

You may likewise acquaint the Honorable Court, that the silk reel, which they did me the honor to transsmit, through the channel of government, having been placed in my filature, was found to possess no principle of advantage superior to the reel of Vaucanson, and that on account of the want of velocity, it has

been fet aside.

It may not be improper, likewife, to acquaint the Honorable Court, by the first dispatch, that the filk manufacture, and the culture of Cochineal, of which we are now in possession, and for both of which, the climate and genius of the people are better adapted, than in any other part of the world, are arrested in their progress by a value being put upon waste land; the expence of bringing which under cultivation, is at all times so great, that few will attempt it, without immunities, privileges and countenance.

JAMES ANDERSON.

Fort St. George, August 20th, 1795.

To JAMES ANDERSON, ESQUIRE.

AVING been up the country, for this month paft, has prevented me from fooner acknowledging your much effected favor of the 1st ultimo.

The friendly steps you have taken to promote my interests, shall ever have my warmest and most sincere thanks, and I am happy to inform you my exchange into the 74th regiment has taken place, and that I mean to take the first opportunity of joining it, and will probably have the pleasure of paying my respects to you on my way to Pondicherry.

I was particularly happy to hear that the species of nopal the Cochineal feeds upon, grows in such abundance all over the Carnatic, in my late trip up the river I found it growing in great abundance to the height of 9 or 10 feet, and with very few prickles on the leaves, which is a great advantage, as the infect

is easier taken off.

I was down yesterday at the Company's Garden, where I found Mr. Smith, who has charge of it, has about 1000 fine plants covered with the insects; there is now enough to stock all India, and as Mr. Smith is indetatigable in planting, there will foon be enough to spare, for any experiments that may be wished, to ascertain the quality of the dye.

I was particularly happy to find that many of the infects, which were placed fix weeks ago on plants in the garden, and exposed to the weather, notwithitanding there has been a good deal of heavy rain, have had a progeny, and that neither the young nor old

appear to have been the least injured by the exposure.

I hope you received the plants and infects, Dr. Roxburgh fent you fometime ago, and that they are succeeding, I intend bringing you a fresh supply, and have no doubt of seeing in a very sew months the plant and infect an object of cultivation over all the Carnatic, which I am inclined to think a more favorable climate for it than that of Bengal; I now enclose for your perusal a copy of a letter I have been honored with from the Governor General in Council, it is very flattering, and contains every thing that can be wished.

Great numbers of gentleman in Bengal have already begun nopal plantations, and Doctor Roxburgh, has fent the infect to

different parts of the country.

R. NEILSON.

Fort William, August 3d, 1795.

To CAPTAIN NEILSON.

OCTOR ROXBURGH, the fuperintendant of the Company's Botanical establishment, has acquainted the Governor General in Council that you have delivered to him a number of cochineal infects, &c. procured at Rio Janiero.—The value of

the present can only be ascertained by experience, but whetever that may prove, the Governor General in Council has directed me to request your acceptance of his thanks, and acknowledgements for your endeavors, and attention to open a new source of com-

mercial emolument for the Country and the Company.

The Governor General trusts that neither his nor your expectations of the advantages to be derived from your exertions will be disappointed, and in this expectation it will afford him particular fatisfaction to inform the Honourable Court of Directors, that a valuable article of commerce has been introduced into this country by your means, and to recommend a remuneration in proportion to its importance.

I am further directed to add, that Doctor Roxburgh has re-

fects and plants, if you should wish to have them.

E. HAY, SEC. TO THE GOVERNMENT.

Council Chamber, June 29th, 1795.

To DOCTOR JAMES ANDERSON, PHYSICIAN GENERAL.

SIR,

HAVE the honor of herewish transmitting to you a copy of
the report forwarded to Government on the Cochineal infects
you delivered to my charge, which from thriving fo well offer every prospect of extensive benefit to the country, the object of
your views.

ANDREW BERRY,

Superintendant Hon. Com. Nopalry. Fort St. George, August 27th, 1795.

To THE RIGHT HONORABLE LORD HOBART,

MY LORD,

I HAVE delayed till now reporting on the Cochineal infects, which Doctor Anderson informed Government, on the 22d ultimo, he had delivered to my charge, that the infects having gone through all their stages, I might speak with some degree of certainty as to the success of their culture here, and with pleasure I can say, that the climate seems most congenial, that they have thriven in all situations, both sheltered and exposed, even to the direct rays of the sun, and to wind and weather, and encountered during the short time they have been here as bad weather.

for them, as can happen except during the monfoon, strong wind accompanied with heavy falls of rain.

The infect too has come to its full growth and produced young even in shorter time than was found in Bengal, having placed young infects on the country nopal on the 24th ultimo, which on the 24th instant produced a new progeny; this quick growth, more than double what happens in Mexico, its hardiness and numerous issue, with the facility that the nopal, on which it thrives, is reared, and the great abundance this plant is now in on every part of the Coast, since Doctor Anderson first called an attention to it in 1787, afford every inducement to an extensive and speedy cultivation.

I have now above 100 plants of the country nopal in the garden, and feveral in the Choultry in pots, with infects placed on them, and can have no hefitation in faying that by this time next month, there will be fufficient to carry their culture to any extent, and even now I should be happy to fend a breed to whomever may be induced to rear them.

Having hitherto cultivated a variety of foreign nopals for this purpose, on all of which I have also experienced the same want of fuccess in rearing the insects that Captain Neilson, and Doctor Roxburgh did, and that the country nopal first cultivated, as being common and confidered less valuable had been thrown out, I am now employed planting the country nopals in their room, and intend only keeping a portion of the Kew nopal in the garden, as this plant is undoubtedly what the fine cochineal is reared upon, and which from this fortunate commencement may also be expected; but independant of this the young leaves of the Kew nopal, are the best succulent and wholesome vegetable, that can be carried to fea, and will remain good for many months, and of which Commodore Rainier has had feveral supplies, many Captains of Indiamen and others, who have acknowledged its utility. -I have already transplanted about 2000 rooted country nopals, and placed them 6 feet afunder, and in a short time more will have 5000, and I am interfecting the fields with hedges of odina (wodier) branches enclosing nearly every 100 plants, as Doctor

Having told your Lordship that the insects have thriven in every situation, I must however observe, that they have been most numerous when sheltered in some degree from the wind and direct rays of the sun, for which purposes odina sences and slight pandalls

Anderson thinks it of great value as a sence almost immediately formed, easily procured, of quick growth, and that will live in

every foil.

dalls of cocon nut or palmiraleaves, fufficient also to keep off any fudden fall of rain, will answer, and with these there can be no doubt the infects may be as numerous on each plant as is thought proper.—as they never can be cultivated to any extent if allowed to remain on the same plants, they are what is termed sown, that is, two or more females full grown are placed according to the fize of the plants, at the divisions of the branches, in the most favorable fituation for the young infects to spread over them, in bags, the corners being tied together, of 2 inch square pieces, of the fibrous covering of the stems of cocoa-nut leaves, the parenchyma of which has been destroyed by the weather, leaving only a network of the fibres, that the young may be able to pass freely through them, these females must be taken as soon as any young appear; -or what I have found answer very well, when a leaf of a nopal can be spared, is to cut it into pieces according to the number of females adhering, and with the thorns of the plant fix these pieces wherever they may be wished; when this is done, the only other attention that is required is to keep the ground clean about the roots of the plants to drive away vermin, and perhaps water the plants a little till young again appear, when fuch females as are wanted for breeding are without loss of time placed on fresh plants as before described, and the remainder of the infects gathered also as quickly as possible, and plunged into boiling water-between two cloths, till the water covers the whole, when they are taken out and dried in the fun and then are fit for the market; the quicker all this is done the better, for the young constituting the finest colouring part, if they are allowed to escape, they cannot be collected, and the mothers become of little value, foon nothing but an empty hulk; the plants are then washed and cleared of infects, and allowed to recruit for a month or two, for a succession of many infects on one plant will certainly destroy it. What is farther confidered necessary, is to have plants in pots or boxes under cover or in places that can be covered, to preferve a breed from heavy falls of rain and in wet weather, I have now therefore and shall always have in the choultry, the only cover at the nopalry, a fufficient number of plants in pots for this purpose, so that they may be distributed at any time.

La Having thus stated to your Lordship all regarding the culture of the infects that occurs to me, and what I have been doing, it may be only proper to add in respect to its intrinsic value, and value to this country, that the dye of the silvester cochineal, which this is, is by no means inferior to the grana sina, and is only of less value about one third, from the silky co-

vering

vering which adding to its weight makes equal parts not equally colouring, but this covering renders it more earliy reared and a more certain produce than the other, fo that in Mexico it is the principal culture of the poor, requiring no flock, and but few hands to earn a fubfiftence on frequently the worlt ground, and employing only the feeble and old, women and children.

I am, My Lord, &c.
ANDREW BERRY.

Fort St. George, August 26th, 1795.

To DOCTOR ANDERSON, MADRAS.

THE favor of your letter was received, and laid before the Board of Agriculture who expressed themselves much pleased with your communication, and having requested me to convey you their thanks, I take the earliest opportunity of doing so with pleasure.

Your continuing to communicate any thing interesting to the cultivation of our Indian territories will be gratifying to the Board, who are extremely sensible of the advantage to be derived from such affistance as yours, in the measures they are now pursuing.

JOHN SINCLAIR.

Board of Agriculture, Whitehall, London, March 10th, 1795.

TO SIR JOHN SINCLAIR, BART.

PRESIDENT OF THE BOARD OF AGRICULTURE,

LONDON.

HAVE the pleasure to inclose a letter from Shamir Sultaun, Esq., acknowledging the receipt of a vest of the new manusacture which arrived here on the Lord Thurlow, where by I am enabled to thank you for a similar mark of attention to myself.

The fentiments of the Board of Agriculture, conveyed in the hand writing of their Prefident, I confider a great honor, and I shall be happy if any thing in my power can promote their lauda-

ble intentions of public welfare.

At prefent however, there is nothing I can recommend to your notice, except a letter from Mr. Bogle, furgeon of the Honorable Company's Lombay ship the Swift, in which if there appears any new information, you will do me the favor to lay it before the Board.

The Right Honourable the Governor here, has been fo good as to receive the questions for agricultural surveys, you did me the honor honor to enclose, and will no doubt exert the most effectual means to render them of use, as most of the questions can be answered immediately by the village writers, an immemorial establishment of record in every village in Hindostan.

JAS. ANDERSON.

Fort St. George, September 10th, 1795.

QUERIES.

BOARD OF AGRICULTURE;

To be Answered by Intelligent Farmers.

1.—What is the nature of the foil and climate in your neighbourhood?

2.—The manner in which the land is occupied, and whether

the farms are, in general, fmall or great?

3.- The manner in which the land is employed, whether,

in pasture, in husbandry, or a mixture of both?

4—If in pasture, what grasses are cultivated, what species of stock is kept; Whether the breeds can be improved, or whether new breeds ought to be tried?

5.—Whether any of the land is watered, and whether any confiderable extent of ground is capable of that improvement?

6.—If the land is employed in Husbandry, what are the grains principally cultivated?

7.—What is the rotation of crops, and in particular whether green crops, as turnips, clover, &c. are cultivated, and how they are found to answer?

8.-Whether fallowing is practifed or otherwise?

9.—What manures are made use of, and whether particular attention is paid to the making of dunghills?

10.—What are the usual fort of ploughs, carts and other implements of husbandry?

11.—Whether oxen or horses are made use of?
12.—What is the usual feed time and harves?

13.—Whether the land is inclosed or in open field?

14.—What advantages have been found to refult from inclofing land, in regard to the increase of rent.—quantity or qualities of produce—improvement of Stock, &c.?

15.-What is the fize and nature of the inclosures?

16.—Whether inclosures have increased or decreased population?

17.-Whether

27.—Whether there are any common fields, and whether any division of them is proposed?

18.-What is the extent of waste lands, and in what manner

are they at present depastured?

19.—Of what improvement are those waste lands most capable, whether by being planted, converted into arable, or into pasture land, or by correcting the present mode of commonage?

20.—What is the rate of wages, and price of labour, by the day or the piece, and what are the hours at which labour com-

mences and ceases, at the different seasons?

21.—Whether proper attention is paid to the draining of land, particularly the fenny part of it, and what forts of drains are commonly made use of?

22.-Whether paring and burning is practifed, and how is it

managed and found to answer?

23.—Whether the country is well wooded, and under what fystem are the woodlands kept?

24.-What is the Price of Provisions, and whether the price

is likely to be steady, to rise or to fall?

- 25.—What is the state of the roads both publick and parochial, whether they are in good order, and whether any improvements in regard to making roads have been discovered?
- 26.—What is the state of farm houses and offices, whether in general they are well fituated and properly constructed?
- 27.—What is the nature of the leafes commonly granted, and what are found to be the most advantageous convenants between the landlord and tenant, for the improvement of the ground?
- 28.—To what extent have commerce or manufactures been carried on in the diffrict, and have they had either good or bad effects on its agriculture?

29.—Are there any practices in agriculture within the Country

that could be of service to other countries?

30.— re there any focieties instituted in the country, for the improvement of Agriculture?

31.—Whether the People seem to have a turn for improvement, or how such a spirit could be best excited?

32.—What improvements can be suggested either in regard to the stock or the husbandry of the Country?

33.—What are the fituations, and nature of the foil; where

the Rot in Sheep is the most prevalent?

34.—What are the forts of Herbage produced from these lands?

L

35 .- Have any means been used to cultivate any of such lands,

to prevant the rot, and what have been practifed?

36.—What is the nature of the foil and herbage where the Sheep took rot last winter, and where they never were known to rot before?

37.—Are those lands old sward, or sown with seeds, or both?
38.—Are there any obstacles to improvements, and in what

mauner can they best be removed?

To DOCTOR ANDERSON, MADRAS.

I HAVE the pleasure of yours of October, and find you going on actively as ever. I am just delivered of a ponderous work, and have pur a copy under the care of Mr. Gazeley, of which I beg your acceptance.

This has taken up fo much of my time, that I have hardly been able to think of any thing else: I observe that Roxburgh is gone to Bengal, and expect soon to hear of his determination about re-

turning to the Coast.

I hear that a proper gardiner is going out from hence, a specimen of engravings made from Roxburgh's drawings, will be given to the Court of Directors in a sew days, together with a plan for their publication, agreeably to the scheme which I proposed to your Board when I was in India, if the Directors persist in their tesoution, the work will be a splendid one.

The reviews contain accounts of all philosophical books; but politics take up the attention of every one—I am just setting out

for the country.

STATISTICS.

PATRICK RUSSELL.

London, July 1A, 1795.

To DOCTOR ANDERSON. P. G.

OU gratify me highly, in supposing I may be any way ferviceable in promoting the useful arts, I shall certainly aim at it in whatever comes recommended from you.

No doubt you will think it advisable to colonife your red-coat family in many stations, so as to prevent riking the loss of the species by any partial accident, and perhaps it might not be improper to mix some plants of the Kew nopal or other innosensive fort, with the naga calli, with the intention of affording the insect an opportunity of taking to it if they will.

The naga calli shall be planted here as you direct, immediate. ly: I suppose it will be necessary to wait their vegetation before you fend me any of the Cochineal infects, and if you think it proper, I request you will also send some of the innosfensive nopal. I have made enquiry, and am informed there are three forts of nopals common here.

Trichinopoly, 28th August, 1795.

Towns and the last TO DOCTOR ANDERSON, P. G.

Condapilly, August 27th, 1795.

JOHN FLOYD.

RETURN you my fincere thanks for the account of the L Cochineal infects you were fo good asto fend me some time ago, which I should have acknowledged sooner but have been much indisposed with fore eyes, a disease very common here at present.

A great deal of this valley laying wafte might with little trouble or expence be employed in the cultivation of the opuntia, indeed it feems fit for little else. I have no doubt, were Government to give the smallest encouragement to it, many people here would very foon be induced to cultivate the Cochineal, but without some attention from Government, they will not easily be brought to believe it a matter of any confequence.

If you will favor me with a few joints of the opuntia I will cultivate it myfelf, and do all I possibly can to make some of the more liberal part of the natives cultivate it also: probably if Government were to allow a small gratuity for every certain quantity of Cochineal manufactured by the natives, and taken in part payment of kists, it might prove a means of introducing the general

cultivation of the little infect.

ROBERT GALLAWAY.

To Mr. GALLOWAY, ASSISTANT SURGEON.

at Condapilly.

TOUR idea is so proper regarding the mode in which the Cochineal infects may be rendered productive that it demands my most fincere acknowledgements, and to affure you that by applying to Lieut. Freeman at Masulipatam you may obtain a supply of any number of plants that you may want, and I will take care that a breed of the infects are forwarded to you in due time.

The establishment of a Nopalry here having been made some years ago and now the compliance of Government with the orders of the Honorable Court of Directors in defraying the expences I have incurred, leaves no room to doubt that much attention, will be given to the improvements I have introduced, and as you juftly observe, were Government to hold out the smallest incouragement to the people, many of them would very soon be induced to cultivate; as on the other hand without that countenance the people must imagine that my plans of industry are contrary to the views of Government.

JAMES ANDERSON.

Fort St. George, September 2d, 1795.

To DOCTOR ANDERSON, MADRAS,

BEG to acknowledge the favor of your transmitting me the account of the Cochineal insect, together with Mr. Secretary Webbe's letter, with the extrast of a letter from Canron under date 25th March, 1795; and farther to offer my congratulations on your success with the nopal and its valuable little insect, sincerely hoping to see the annual silk worm of China added to the number of your achievements, since it is become a more desirable object of attainment than ever from the grand project resolved on and adopted by the Honorable Court of Directors, of which doubtless you are informed, namely the ordering that their best silks should be wound since nough to be converted by them into organzine, through the medium of our own mills at home; a plan which can never be prosecuted to the extent they have laid down, till funch time as we can improve their quality by encreasing the strength of the staple.

The specimens of raw silk I have with great pleasure reported on from you, are very superior in this respect to the silks the growth of Bengal; how desirable therefore that the growth of this valuable article should be encouraged with you! but be it remembered that although nothing is more easy than the making of sine threaded slature silk, yet as I have invariably endeavoured to show the more sine, the less valuable, unless at the same time, made perfectly free from gouts, perfectly free from ends, and

perfectly free from the fine waite.

You feel how exceedingly we have to lament more than you, the little fuccess that hath hitherto attended, the application made to the superacargoes at your instance, as the fate of the sew eggs sent here by his Excellency Lord Macartney every one of which had been hatched before they reached me.

The filk produced both in Perfia and Turkey, are remarkable for their strength of staple; suffer me to suggest, that perhaps it would be no very difficult matter through your multifarious correspondents, to obtain the feed of these countries, the latter especially, through the intervention of Mr. Manesty at Bussons.

Two things have occurred to me, which I beg leave to fuggeft to you, from a tendency which you will probably find in them, to do away fome of the difficulties you have unfortunately had to contend with in rearing the filk worm; It would feem that the great diffance of Nankeen, from Canton, must have proved a great obstacle in the attempt of the Residents to procure the annual worm for you, there is no doubt the obtaining them from thence would more assured a scertain the real fort, since from climate they are not likely, to have any other than the annual worm.

But there is no reason why the annual worm should not be found in the Southern provinces, and whereas in Bengal, although the monthly worm be the principle object of cultivation, the annual is and may be occasionally met with, and very probably in the

vicinity of Canton itself.

I suspect that the hot winds for the worm and the drought for the mulberry must have proved your most cruel enemies, and deprived you every now and then of a whole bund compleat.

Now suppose you were to confine your cultivation to the annual worm only you might choose your season, and by that means, be fure of success, for having cut and prepared your mulberry, you need not putyour worms to hatch, till the moment you was affured of their keeping pace with each other.

The annual worm with us here is generally put to hatch about the begining of February, thould you be disposed to try this, I will with great pleasure forward you some of the annual seed of

this country.

JAS, FRUSHARD.

Calcutta, August 17th and 18th.

TO THE RIGHT HONORABLE LORD HOBART,

MY LORD,

I HAVE the pleasure to inclose two letters from Mr. Frushard, regarding the best fort of annual filk worm, in hopes that your Lordship will see the expediency of directing copies of them to be forwarded by the first opportunity to the factory at Cauton, and the government at Bombay, for the purpose of obtaining eggs of this breed, in the manner he has devised.

I have the honour to be, my Lord, &c.

JAMES ANDERSON.

To JAMES FRUSHARD, Esq.

AM favoured with two letters from you, dated the 17th and 18th Ultimo, the contents of which appear so much to the purpose for procuring the most valuable kind of annual filk-worm, that I have recommended them to the attention of Government.

I am much obliged by your offer of fending me the annual filk worm of Bengal, but think it would be giving you unneceffary trouble, as two years care of them has now put me in posse-

ssion of a sufficient stock.

The plan you mention of keeping this breed only, although it might prove advanta yeous, yet I think it would be hazardous to adopt it, lest the people should forget the business altogether in follong an interval, and the high character of the filk of our monthly worm, which fells in the market here at forty three pagodas the Madras maund, are weighty reasons for preserving it.

Notwithstanding what appears in my publications regarding the drying up of the eggs in the hot months, yet now by having them laid on mats, that have been covered over with Cowdung, not an egg fails in the hot more than in the cold months, and in case the fields are watered once a fortnight, the produce of

leaves is very abundant.

The only real difference I can observe is, that in the cold months, the cacoons and the leaves, are both of a larger fize than in the hot and dry season, but the filk is stronger, as well as the leaves more consident for their fize in the latter season; and foul air, which is easily obviated, is the only enemy to the worms.

Upon the whole, although there may be fome advantages refulting from the differences of heat and cold, moifture and drynefs that will remain till fuch time as we get more experience, yet the great equality of the temperature of our atmosphere, the doeility of the natives, and the superior strength of the produce, must certainly render the culture of filk here, an object of great

importance.

To bring it into effect, I recommended that opulent natives hould be encouraged to come forward, who could employ fufficient hands, that would otherwise remain idle, as the cultivation of grain which is the main object, lies in the hands of the villagers, and not amongst the inhabitants of towns; but as the few whom I had an opportunity of recommending, think they have been discouraged, it is likely that this valuable manufacture will make but flow, if any farther advances, beyond what it is at prefent.

It is still confined to the Company's plantation at Vellour, that of a lociety of gentlemen at Poonoomalloe, Permall at Voyalore, Rangapilly, at Adyar, Armogam at Coomungalum, and a plantation of the Honorable Company's at Ganjam, where the cheapness of labour, and fertility of the foil, as well as its vicinity to Bengal, are supposed to be favourable circumstances, whereas it has always been my wish and endeavour to place it in the hands of the natives at large, for which purpose I long ago recommended that an article to this intent should be inferred in the obligation bonds that were expected to have been granted about this time, but have reason to believe no proper notice has been taken, from a nistaken idea of the culture of Silk preventing the culture of grain:—there are likewise considerable plantations of mulberry at Chingleput, Guntoor, Chicacole, and Vizagapatam, lying useles.

Should it ever appear that government wish to promote this manufacture, there can be no doubt but that your annual Bengal worm may be introduced with advantage into parts of the country that from want of water are unfit for the monthly fort, as the mulberry when rooted, can survive a very long drought, and an universal verdure prevails immediately after the rains, the sea-

fon at which the annual worm naturally hatches here.

JAS. ANDERSON.

Fort St. George, September 4th, 1795.

To the right honorable LORD HOBART, GOVERNOR, IN COUNCIL.

MY LORD,

A SENSE of the numerous and important corcerns of government, leaves me almost ashamed so frequently to trouble your Lordship, but having long observed that researches of this nature become useles, unless recommended to the notice of those who possess the springs of action, and believing that your Lordship is well disposed to promote every investigation connected with the public welfare, without farther taking up your Lordship's time with needless apologies, I shall proceed to state:

That the caoutchouc, elastic gum, or indian rubber, a subflance now well known in Europe, as applicable to the improvement of many of the most necessary and uleful arts, is the produce of the Eastern Islands, as well as of Guiana in America, from whence Europe has hitherto been supplied with this valuable

fubstance.

My authority is a letter from Mr. Kincaid, at Prince of Wales's Island, dated August 21st, 1792, of which the following is an extract.

" The elastic gum as it is called, is found in these Islands, and the juice gathered and put in bottles, if kept excluded from the air will carry to England, some of it goes home in this ship from Mr. Light, to Mr. Dalrymple; if exposed to the air, it foon stiffens, and then is perfect caoutchouc, it is faid to be the produce of a vine, but from what little I have been able to collect, the plant feems more of the reed kind, being as thick as a large bamboe."

In January last, I received a small quantity from Doctor Campbell, at Bencoolen, and this morning Mr. William Roebuck, delivered me a little he had procured in the following enclosure.

"I fend you a specimen of the elastic gum, caoutehoue, found in the island of Pooloo Pinang, by the Surgeon of the Settlement; knowing your attention to subjects of this nature, and as I think it is a discovery that may be of advantage, I am happy to deliver it into your hands."

My intention in troubling you at this time is with a view to induce your Lordship to solicit the Supreme Government's attention to the subject, by recommending to the settlements of Bencoolen and Pooloo Pinang, the care and cultivation of the plants in their neighbourhood, and to embrace every opportunity of transmitting some of them to the botanical garden at Calcutta, as well as to this place.

I am, MY LORD, &c.

JAMES ANDERSON.

September 5th, 1795.

To JAMES ANDERSON, Esq. P. G.

T CANNOT refift the impulse of acquainting you, that I have I fucceeded in what I have been for fome months attempting to acquire, that is a daily breed of filk-worms, and have at this moment thirty fuccessions in high health, it is a most pleasing object to me, and I imagine it would give fome fatisfaction to you, to fee the different gradations from the egg to the egg again all going forward at the fame instant.

I have the honor to inform you that I have planted 5,000 large nopals fince the begining of last month, most of them in great vigor, throwing out a crop of new leaves, and fome already bearing flowers, they will foon I think be able to feed the cochineal infect on, and hope you will indulge me with a breed.

A BLACKADDER.

Mulberry Plantation, Poonamallee, September 4th, 1795.

To THE RIGHT HONBLE. LORD HOBART, GOVERNOR, IN COUNCIL.

MY LORD,

IN fupport of the wishes of the Honorable Court of Directors for a silk manufacture, I have the pleasure to inclose a letter from Mr. Blackadder, expressing his success in bringing about a daily hatching of the worms, which as it must prove a great relief to the labour, as will as the supply of leaves, and security against losing the breed; I consider it of too much importance to be overlooked, and therefore recommend, that your Lordship will be pleased to direct a monthly falary sufficient for his maintenance, to enable him to prosecute his success.

I am, MY LORD, &c ...

JAS. ANDERSON.

Fort St. George, September 9th, 1795.

To DOCTOR ANDERSON, P. G.

OBSERVING in the public Courier you direct fuch perfonewho wish to promote the culture of filk, to apply to you foreggs; you will greatly oblige me by allowing me a few, as we have a mulberry plantation at a very short distance from Vizagapatam, so that the feeding them will be attended with no inconvenience.

ROBERT WISSET.

Vizagapatam, August 29th, 1795.

To JAMES ANDERSON, Esquire, P. G.

AM directed to acknowledge the receipt of your letter dated 20th ultimo, 3d and 5th initiant.

The remarks of Mr. Frushard upon the best mode of procuring the annual filk-worm will according to your suggestion be M recommended recommended to the gentlemen at Canton and Bombay, and a copy of your letter respecting the elastic gum of Summatra and Pinang, has been submitted to the consideration of the Governor General

in Council of Bengal.

The President in Council, is happy at the discovery made, by Mr. Blackadder, and hopes that it will prove beneficial to his employers, but does not feel himself at liberty to incur on the Company's account, the monthly expende of the allowance which you have recommended, for that gentleman,

I. WEBEE, SECRETARY.

Fort St. George, September 12th, 1795.

To JAMES ANDERSON, Esq. P. G. FTER hoping these few lines may find you in perfect health, I take this opportunity per favour of the dooly bearers to acquaint you that I have found Captain Read here, and have nooccasion to go to Kistnagurry, therefore have sent the dooly back, for which I return you many thanks.

I have likewise the pleasure to inform you that I have got the Cochineal infects fafe up, and Captain Read, feems to be very proud of them; I believe that to day we shall look out for plants, and make ready for placing out the infects as foon as they may be

fit.

EYRE W. LYTE.

Trippatore, in Baramall, 13th Sept. 1795.
